2. INTRODUCTION

The purpose of this manual is to introduce and explain the version **V4.60** main system feature package for the **OfficeServ 7000 Series** of business telephone systems. Version **4.60** represents a major overhaul of the **OS 7000 Series'** IP capabilities to bring the system more in line with modern customer needs.

In addition to adding support for multiple SIP Service Providers and synchronizing the system clock to a **Network Time Protocol (NTP)** server, version **4.60** also makes some fundamental changes to the way that IP calls are processed allowing for a much more efficient use of both **Media Gateway Interface (MGI)** and **Media Proxy Service (MPS)** channels. Version **4.60** also adds and extends a variety of system features and introduces a variety of hardware expansion cards:

- **SVMi-20i**
- **8COMBO3**
- **8SLI3**
- **16SLI3**

The chart in the next section lists the features and changes supported by V4.60 along with the OfficeServ 7000 Series system(s) supported.

3. FEATURE & HARDWARE LIST

FEATURE	7030	7100	7200S	7200	7400
Conference Card Enhancements	No	No	Yes	Yes	Yes
DID Max Calls Per Ring Plan	Yes	Yes	Yes	Yes	Yes
Download phone book to SMT-I phones	Yes	Yes	Yes	Yes	Yes
DTMF Support on SIP Stations	Yes	Yes	Yes	Yes	Yes
Emergency 911 Conference Feature	Yes	Yes	Yes	Yes	Yes
Enhanced Plug-N-Play	Yes	Yes	Yes	Yes	Yes
Malicious Call Restriction	Yes	Yes	Yes	Yes	Yes
Max Calls in Queue Feature	Yes	Yes	Yes	Yes	Yes
MGI Allocation Change	Yes	Yes	Yes	Yes	Yes
MOBEX Enhancements	Yes	Yes	Yes	Yes	Yes
MP Enhancements	Yes	Yes	Yes	Yes	Yes
Multicast Paging Support	Yes	Yes	Yes	Yes	Yes
Multiple SIP Service Providers	Yes	Yes	Yes	Yes	Yes
NTP Server Support	Yes	Yes	Yes	Yes	Yes
Presence Awareness Enhancements	Yes	Yes	Yes	Yes	Yes
Secure RTP (sRTP) Support	No	No	No	Yes	Yes
Security Enhancements	Yes	Yes	Yes	Yes	Yes
SIP Trunk Enhancements	Yes	Yes	Yes	Yes	Yes

SVMi-20i Support	No	No	No	Yes	Yes

4. FEATURE DESCRIPTION

This chapter lists the features in the V4.60 software package. Each feature is broken down into up to five sections corresponding to the traditional OfficeServ 7000 Series Technical Manual sections:

- General Description
 - This section will describe the purpose and market usage of the feature
- Installation
 - For hardware or applications this section will detail the installation of the equipment or program
- Programming
 - This section will detail any relevant Device Manager menu changes relating to the feature
- User Instructions
 - For features that are user-facing this section will describe how a user can access and use the feature

4.1 Emergency 911 Conference Feature

GENERAL DESCRIPTION

For networked systems or large enterprise businesses it is critically important that **911** calls be monitored and tracked not only so that the right people are aware of emergency situations, but also so emergency personnel can be directed properly.

Version 4.60 adds a new **911 Conference** feature that monitors the system for any user dialing **911** and performs a series of actions:

1. The **caller** who dials **911** will be routed by highest priority to emergency services. This means that if **all trunks** are **busy** or **all MGI channels** are **in use** the system will **automatically drop a call in progress** in order to make available resources for the **911** call.
2. The **911 call** will be **logged** to the **System Alarm Log**.
3. Up to **3 predefined monitoring stations** will ring with an **alert** of a **911** call. Upon answering the call the **monitoring station** will be **added to a conference** with the **station who dialed 911** and the **trunk connected to the 911** operator. If the **monitoring station** user wishes to **speak** to the **911** caller or the **911** operator they can **un-mute** their phone to speak.

PROGRAMMING

The **4.10.2 Emergency 911 Destination** Device Manager Menu has been added to support the **911 Conference** feature.

4.10.2.Emergency 911 Destination					
Item	Member 1		Member 2		Member 3
	T/S No	Outgoing Digits	T/S No	Outgoing Digits	T/S No
Value					

FIELD	PURPOSE
Member 1 ~ 3	Sets up to 3 stations that will be auto-conferenced in when any user dials 911 . These can be local station numbers , SPNet stations , or external numbers .

The trunk group for 911 uses needs to be added in **4.8.4 Toll Pass Codes**.

4.8.4.Toll Pass Codes		
Item		Value
PBX Code	1	
	2	
	3	
	4	
	5	
Special Code	1	
	2	
	3	
	4	
	5	
	6	
	7	
	8	
	9	
	10	
Toll Override	1	
	2	
	3	
	4	
	5	
	6	
	7	
	8	
Over Use Trunk Group		2800

FIELD	PURPOSE
Over Use Trunk Group	Sets up one trunk group for 911 call to use.

Note: 911 conference feature supports PRI and SIP trunking only.

GENERAL DESCRIPTION

Version 4.60 system software for the OfficeServ 7000 Series also marks the launch of Phase 2 of the 24-port OfficeServ Conference Card. Phase 2 does not change any hardware or alter the way a Conference Card is installed, but rather provides a significant number of feature additions and enhancements to the Conference Card's software. The new and enhanced features are:

- **Add-to-Calendar With ICS Attachment**

When the Conference Card sends invite emails to attendees they now contain an **iCalendar (.ics)** file attachment, which is an industry standard calendar file that can be added to most any personal or business calendar.

- **Retry on Invalid Conference ID or Password**

When an attendee accidentally enters an invalid conference ID or password they will now be prompted up to **3 times to retry** before being disconnected whereas older software would disconnect immediately on an invalid entry.

- **Conference Email Login Instructions Support**

In Phase 1 the login instructions sent in the conference email had to be reentered each time a conference was created, meaning that users had to maintain their own set of instructions to copy and paste during every conference creation. Phase 2 has added the ability to save a **system-wide instructions template** that will be used for every conference.

NOTE: *Users may still set their own instructions if desired while creating their conference; the saved instructions are only populated for convenience.*

- **New Prompt Languages**

In addition to **US English** the following prompt languages have been added: **Korean, UK English, Australian English, German, Greek, Italian, Russian, Castilian Spanish, Turkish, Finnish, French, Dutch, Danish, Portuguese, Swedish, and Norwegian**. When the prompt language is changed the **Conference Invite Email** template language is also changed.

NOTE: *Conference Login Instructions will still need to be entered in the correct language if the prompt language is changed.*

- **Set Conference Time Zone**

To avoid confusion when inviting conference attendees from different or multiple time zones, Phase 2 allows the user to set the **local time zone** for the conference. This ensures that when attendees add the conference to their calendar they are saving the correct time.

- **Enhanced Member Kick**

In Phase 1 if a user was kicked out of the conference they were unable to rejoin. Phase 2 now allows two options when kicking a member: **Keep** and **Clear**. **Keep** means that the member kicked out **cannot** log back in to the conference, and is the default option. **Clear** means that when a member is kicked out they **are** able to call back in and log in to the conference. **This is a system-wide option** that affects all conferences and **cannot** be changed for individual conferences **or** during a conference.

- **Station Search During Conference Creation**

When creating a conference through the web interface users can now search for and add **any station** in the system without the technician first having to program the list of valid members.

- **Conference Email With Sender Address**

Phase 2 has added the ability to specify a user's "from" address in the conference invitation email. This ensures that attendees can reply to the invitation with any comments or questions without having to write a new email.

- **View Conference Card Port Status**

Technicians may now view the status of **Conference Card ports** through the **Device Manager**.

- **Daylight Savings Time Support**

The system will now automatically adjust the time on conference invitation emails to account for **Daylight Savings Time** based on the current time zone and **Daylight Savings** date list.

- **Schedule Recurring Conference Reservations**

When creating a conference, users may now set their conference to recur **daily** or **weekly** for up to **3 months**.

- **Extension Email Address Support**

Version 4.60 software and the Phase 2 Conference Card software now allow users to enter their own email address to be used when they are invited to attend a conference. Technicians and system administrators may still enter the list of addresses, but it is now possible for users to add or edit their own information.

PROGRAMMING

Two Device Manager Menus, **9.1.1 Conference Options** and **9.1.7 CNF24 Voice Management**, have been edited and three new menus, **6.2.9 CNF24 Status**, **9.1.6 Email Address**, and **9.1.8 Email Conference Instructions**, have been added to support the Phase 2 software.

6.2.9 CNF24 Status

This menu is used to monitor the status of channels on the **Conference Card**.

6.2.9.CNF24 Status						
Cabinet/Slot	Index	Status	Tel Number	OPP IP Address	RTP Port	Codec
	1	NONE				
	2	NONE				

9.1.1 Conference Options

This menu is used to set system-wide **meet-me conference** parameters.

9.1.1.Conference Options	
Item	Conference Options
Leave Alarm Options	Off
End Alarm Options	Off
Early Ent Time	0
Mail Server Options	Off
Mail Max Retry	3
Mail Retry Interval	5
System Time Zone (GMT)	+00 00
Max Rec Time (min)	300
Mail Server Port	
Local Domain	
Mail Server User ID	
Mail Server Password	
Mail Server Domain/IP	
DNS IP	0.0.0.0
Record Alarm Capacity	70
Record Delete Capacity	90
TALK Out Option	keep
Prompt Language	English(USA)

FIELD	PURPOSE
System Time Zone (GMT)	Sets the time zone of the system based on the offset from Greenwich Mean Time (GMT)
Prompt Language	Sets the language of the voice prompts used by the Conference Card

9.1.6 Email Address

This menu is used to set the **email addresses** for each **station** user in the system.

9.1.6.Email Address	
Tel Number	Email Address
2210	
2211	

FIELD	PURPOSE
Email Address	Sets the email address of the user associated with the selected extension number for the purpose of sending Conference Invite Emails .

9.1.7 CNF24 Voice Management

This menu is used to set **voice prompt** settings for the **Conference Card**.

9.1.7.CNF24 Voice Management		
Card	C1-S11	
Language Set	English(USA)	
No	Comments	
0	Meet-Me Conference Id Request 0000.snd	
1	Meet-Me Conference Password Request 0001.snd	

FIELD	PURPOSE
Language Set	Sets the language for voice prompts on the specific Conference Card

9.1.8 Email Conference Instructions

This menu is used to set the **default login instructions** that will be sent in every **Conference Invite Email**.

9.1.8.Email Conference Instructions	
Conference Instruction	Total byte : 0

4.3 Multiple SIP Service Providers

GENERAL DESCRIPTION

The use of **SIP** telephone lines is quickly being adopted in place of traditional CO lines. As **SIP trunking** usage grows carriers are beginning to see much of the competition the telecommunications industry saw during the launch of **T1** and **PRI** circuits. It is becoming common for a business to need more than one **SIP carrier** to get the best possible cost and flexibility for their operation by, for example, having one provider for domestic long distance and another for international calls or having one account as a backup for another.

Version 4.60 addresses this need by adding the ability to register to up to **four** SIP carriers **simultaneously**.

PROGRAMMING

Two Device Manager Menus have been modified to allow the use of multiple SIP carriers: **4.1.2 Trunk Groups** and **5.2.13 SIP Carrier Options**.

4.1.2 Trunk Groups

This menu is used to configure **Trunk Groups** and their members.

4.1.2.Trunk Groups		
Group Number	8005	8006
Group Index	5	6
Group Type	SIP	SIP
Group Mode	Sequential	Sequential
ISP Selection	Peering	ISP1
1	7201	7201
2	7201	7201

FIELD	PURPOSE
ISP Selection	For Trunk Groups with a Group Type of SIP this value sets which SIP Carrier the Trunk Group will service or if it will be available for SIP Peering .

5.2.13 SIP Carrier Options

This menu is used to set up **SIP Carrier Trunk** connections.

5.2.13.SIP Carrier Options		
SIP Carrier	1	
Item		Value
SIP Carrier Name		Voices
SIP Server Enable		Enable
SIP Service Available		Yes

FIELD	PURPOSE
SIP Server Enable	Enables or Disables the ability to use this SIP Carrier for trunking . Up to 4 SIP Carriers may be Enabled simultaneously.

NOTE: Please refer to 4.19 SIP Trunk Enhancement for important new feature.

GENERAL DESCRIPTION

With the expansion of IP telephone usage is an expansion of threats to business security. **Voice-over-IP** puts business communications on a data network where it is exposed to common data security threats like hackers or network attacks, and the compromise of business communications can be devastating to a company. To help mitigate the risks of **VoIP** telephony, version 4.60 allows **SIP Trunks** and **SIP Stations** on **OfficeServ 7200** or **7400** systems to use the **TLS encryption protocol** to prevent unauthorized access to the system. **TLS** is an industry-standard data cryptography protocol developed specifically to prevent unauthorized access to sensitive network data.

TLS can be enabled for **SIP Trunks**, **SIP Peering Trunks**, and/or **SIP Stations**. However, current softphone and Communicator softphone do not support sRTP.

Note: When TLS is in use, the MP requires more resources to handle the additional load.

- For SIP trunking and SIP peering, the impact is **1:3.5**. That means one TLS connection will use 3.5 SIP channels. For example, if 4 TLS connection are required, the OfficeServ system will reserve 14 (= 4 x 3.5) SIP channels. The overall usable SIP channels for system will reduce because of TLS connection. Each SIP account can be set to TLS individually.
- For 3rd party SIP station, the impact is **1:3**. That means one TLS connection will use 3 SIP stations slot. For example, if 4 TLS connection are required for 3rd party SIPO station, the OfficeServ system will reserve 12 (= 4 x 3) 3rd party SIP station capacity.

PROGRAMMING

Three Device Manager Menus have been modified to support **TLS** on **SIP Trunks** and **SIP Stations**: **5.2.12 SIP Stack/Ext/Trunk Options**, **5.2.13 SIP Carrier Options**, and **5.2.17 VoIP Peering**.

5.2.12 SIP Stack/Ext/Trunk Options

This menu is used to configure connectivity options for **SIP Stations** and **Trunks**.

5.2.12.SIP Stack/Ext/Trunk Options			FIELD	PURPOSE
SIP Trunk Configuration	Item	Value	SIP Connection Reuse	Sets whether or not TLS certification must happen on every call or only once during registration
	Common MSG Block Timer (Sec)	600		
	Register MSG Block Timer (Sec)	60	SIP Mutual TLS Enable	Sets whether or not to use TLS encryption for SIP stations
	Register Retry Limit	1		
	SIP Peering Codec PR1	G.729	SIP Validate Any TLS Certificate	Sets whether the system will reject (Disable) or accept (enable) unknown certificates during the TLS handshake
	SIP Peering Codec PR2	G.711a		
	SIP Peering Codec PR3	G.711u	TLS Port	Sets the TCP port the TLS engine will listen for connections on. The default value is 5061 .
	SIP Peering Codec PR4	Disable		
	SIP Peering Max Channel	224		
	Outgoing Originator Codec Use	Disable		
SIP Extension Option	Incoming Call Fixed Codec	Disable		
	Response to Tag	Keep		
	SIP Connection Reuse	Enable		
	SIP Mutual TLS Enable	Disable		
	SIP Validate Any TLS Certificate	Enable		
	TCP Port	5060		
	TLS Port	5061		
	Session Expires Time (Sec)	4000		
	Session Timer	None		

5.2.13 SIP Carrier Options

This menu is used to set up connections to **SIP Carriers**.

5.2.13.SIP Carrier Options			FIELD	PURPOSE
SIP Carrier 1			Outbound Proxy Port	Sets the TCP or UDP port used to communicate with the SIP Carrier . For TLS this value is typically 5061 .
Item			URI Type	Sets the login method for this SIP Carrier. Options are SIP , TEL , and SIPS .
Codecs Auto Negot			SIP Signal Type	Sets the signaling type for IP packets. Options are UDP , TCP , and TLS .
URI Type			SIP Connection Reuse	Sets whether or not TLS certification must happen on every call or only once during registration
SIP Signal Type			SIP Mutual TLS Enable	Sets whether or not to use TLS encryption on calls for this SIP Carrier
E164 Support			SIP Validate Any TLS Certificate	Sets whether the system will reject (Disable) or accept (enable) unknown certificates during the TLS handshake
PRACK Support				
Hold Mode				
Response to Tag				
SIP Connection Reuse				
SIP Mutual TLS Enable				
SIP Validate Any TLS Certificate				

5.2.17 VoIP Peering

This menu is used to set up connections to **SIP Peers**.

5.2.17.VoIP Peering							
Table No	IP Address	Protocol	User Information	Remote Port	SIP Signal Type	SIP Response to Tag	SIP Connection Reuse
0	105.52.21.62	SIP	7100	5060	TLS	Keep	Enable
1	0.0.0.0	SIP		5060	UDP	Keep	Disable

FIELD	PURPOSE
User Information	The User Information must match on both systems
Remote Port	Sets the TCP or UDP port used to communicate with the SIP Peer . For TLS this value is typically 5061 .
SIP Signal Type	Sets the signaling type for IP packets. Options are UDP , TCP , and TLS .
SIP Connection Reuse	Sets whether or not TLS certification must happen on every call or only once during registration

GENERAL DESCRIPTION

Encrypting a data channel with **TLS** goes a long way toward securing a business' **VoIP** communications, but still leaves open the ability for dedicated hackers to reconstruct an audio conversation. Version 4.60 addresses this security gap by adding support for **Secure RTP (sRTP)** audio streams. **sRTP** is an encryption protocol developed specifically for **VoIP** audio streams and prevents hackers from reconstructing audio even in the event that packets are captured.

Version 4.60 allows **sRTP** to be enabled for any or all of the following: **MGIs** (including **MGI64** cards, **OAS** cards, **SMT-i Series IP Phones**, **SPNet** channels, and/or **SMT-W5120E** WiFi handsets).

Note: When **sRTP** is in use, the **MGI** requires more resources to handle the additional load. The overall **MGI** channel capacity is reduced. **sRTP** is a system wide selection. Once set, all **MGI** channels are set accordingly. That means all **OAS** cards in the system will use the **sRTP** setting. The following are the system capacity table.

Module	VoIP (RTP)	VoIP (sRTP)
OAS		
MPS/RTG (no impact)	32	32
MGI	16	10
MGI16		
MGI	16	10
MGI64		
MGI	64	40

PROGRAMMING

Five Device Manager Menus have been modified and one has been added to support sRTP. The changed menus are **2.1.5 System Options**, **2.7.1 ITP Information**, **2.7.3 WIP Information**, **3.3.1 System Link ID**, and **5.2.16 MGI Options**. The new menu is **5.2.26 SVMi-20i Options**.

2.1.5 System Options

This menu is used to set various system-wide options such as RTP options and area code options.

2.1.5.System Options	
Item	Value
DTMF Type	Inband(RFC2833)
MPS Service	On
No MPS >> MGI	On
SIPT >> SIPT MGI Use	Off
sRTP Algorithm	AES_CM_128_HMAC_SHA1_80

FIELD	PURPOSE
sRTP Algorithm	Sets the encryption algorithm for sRTP in the system (if any). The default value of Disable turns sRTP off for the system.

2.7.1 ITP Information

This menu is used to set options relating to individual IP phones.

2.7.1.ITP Information						
Tel Number	Type	Video Codec	Video Size	QoS Enable	USE sRTP	Multicast Page
2220		H.263	CIF	Disable	Enable	Auto
2221		H.263	CIF	Disable	Enable	Auto

FIELD	PURPOSE
USE sRTP	Sets whether the SMT-i Series IP phone will use sRTP or not.

2.7.3 WIP Information

This menu is used to set option relating to individual WiFi handsets.

2.7.3.WIP Information						
Tel Number	User ID	Handover T.	Handover Delta V.	Handover Sca	USE sRTP	
2230	2230	70	5	1	Enable	
2231	2231	70	5	1	Enable	

FIELD	PURPOSE
USE sRTP	Sets whether the SMT-W5120 WiFi handset will use sRTP or not.

3.3.1 System Link ID

This menu is used to set up communications with other **SPNet** nodes.

3.3.1.System Link ID						
Entry No	System Name	Time Sync	No MGI	Audio Codec	USE sRTP	
Self						
Sys01	le 001 - MP40	On	Off	G.711u	Enable	
Sys02	le 003 - MP20	Off	Off	G.711u	Enable	

FIELD	PURPOSE
USE sRTP	Sets whether the SPNet node will use sRTP or not.

5.2.16 MGI Options

This menu is used to set operational parameters for **MGI channels**.

5.2.16.MGI Options		
Card Type	Item	Value
MGI64/16	Maximum Jitter (ms)	150
	Jitter Adaptation Period (sec)	1
	Jitter Adaptation Threshold (ms)	250
	Fax Option	T.38
	T38 Redundancy	3
	FAX ECM	Enable
	Max Fax Number	2
	RTCP Period	5
	TOS/DiffServ	00000000
	802.1p/q	Disable
	802.1 Priority	0
	802.1 VLAN Tag	0
	Audio Codec	G.711
	Frame Count	G.711 20ms
		G.729 20ms
		G.729a 20ms
		G.723 30ms
	USE sRTP	Enable

FIELD	PURPOSE
USE sRTP	Sets whether the MGI channels on an OAS or MGI64 card.

5.2.26 SVMi-20i Options

This menu is used to set configuration options for the new SVMi-20i card.

5.2.26.SVMi-20i Options		
Card Type	Item	Value
SVMi 20i	Dual Filter Echo Canceller	8TRK2 Mode
	NLP Option	0
	EC Tail Length(ms)	64
	Jitter Adaptation Period(sec)	1
	Jitter Adaptation Threshold(ms)	250
	EC Gain	32
	Noise Suppression	On
	AGC	On
	Dominant Talker	On
	Primary Group	5
	Codec Frame Count	G.711 20ms
		G.729 20ms
		G.729a 20ms
		G.723 30ms
	T38 Fax Use	Enable
	T38 Redundancy	3
	FAX ECM	Enable
	USE sRTP	Disable

FIELD	PURPOSE
USE sRTP	Sets whether the SVMi-20i card will use sRTP or not.

4.6 MGI Allocation Change

GENERAL DESCRIPTION

When the **OfficeServ 7000 Series** premiered all IP traffic was governed by **Media Gateway Interface (MGI)** channels. MGI channels allow IP devices and non-IP devices to talk to each other. Version 4.40 brought a brand new type of resource called **Media Proxy Service (MPS)** channels. **MPS** channels allow IP devices to talk to other IP devices without using a more costly **MGI** channel. **MGI** channels were still used to connect IP devices to non-IP devices, however, so **MGI** channels would be assigned to an IP-to-IP call any time ringtone was playing or a caller was on hold. This meant that systems had to be overstocked with **MGI** channels to support these brief services.

Version 4.60 changes this **MGI** allocation by allowing specialized **MPS** channels called **Ring Tone Generation (RTG)** channels to provide **ringback tone, hold tone, music on hold and DTMF (RFC 2833) tone detection for executive Mobex feature**. This eliminates the need to overstock **MGI** channels and in many situations can reduce system cost by reducing the number of **OAS** or **MGI64** cards or **MGI** licenses needed. There is **1 RTG** channel in the system for every (**1 or 2 MPS** channels).

NOTES:

- 1. The OfficeServ 7200 and 7400 require OAS cards in order to provide MPS channel resources**
- 2. RTG channels are only available when the MPS Service is enabled in the system**
- 3. You need to make sure the RTG ports are opened in the firewall.**
- 4. One RTG call is equivalent to 1 MPS call (or 2 MPS channels). If a system has 8 MPS calls (or 16 MPS channels) capacity and 1 RTG is in used, they will be 7 MPS calls (or 7 RTG) available for use.**

PROGRAMMING

One Device Manager Menu has been changed and one has been added to support this new MPS functionality. The new menu is **6.2.10 RTG Status** and the modified menu is **2.2.15** which has had a name change from **MPS Card** to **MPS/RTG Card**.

MPS Service has to be set to **On** in Device Manager, Port Base Menu, **2.2.5 System Options, VoIP RTP Option** for this feature to be functional.

2.2.15 MPS/RTG Card

This menu is used to configure options for the **OAS card (OS7200-S, OS7200, and OS7400 systems)** or built-in **MPS** and **RTG** channels (**OS7030, OS7100, OS7200-S systems**) as shown below:

2.2.15.MPS/RTG Card	
Cabinet/Slot	C1-S1
Card Type	OAS
IP Address	192.168.9.23
Gateway	192.168.9.1
Subnet Mask	255.255.255.0
IP Type	Private with Public
MPS Local Port	40000
MPS Public IP Address 1	216.62.86.242
MPS Public Port 1	40000
MPS Public IP Address 2	255.255.255.255
MPS Public Port 2	40000
MPS Public IP Address 3	255.255.255.255
MPS Public Port 3	40000
RTG Local Port	45000
RTG Public Port 1	45000
RTG Public Port 2	45000
RTG Public Port 3	45000
RTG Frame Count	20ms

NEW FIELD	PURPOSE
RTG Local Port	Sets the starting port the RTG channels will listen on for local network traffic. The ending port will be (RTG Local Port) + (number of RTG Calls). The default port is 45000 . For example, a starting port of 45000 with 16 RTG calls yields an end port of 45015.
RTG Public Port 1 ~ 3	Sets the starting port the RTG channels will listen on for public internet traffic. The default port is 45000 . This setting is only for use in NAT environments
RTG Frame Count	Sets the codec latency for RTG channels. The default setting of 20ms normally doesn't need to be changed

6.2.10 RTG Status

This menu is used to monitor the connection status of RTG channels. This is extremely helpful in troubleshooting, training, and call tracing scenarios.

6.2.10.RTG Status							
Cabinet/Slot	Index	Status	Destination			Codec	Tone Type
			Tel Number	IP Address	RTP Port		
	1	Busy	7209	206.80.67.28	52460	G.711u	Music
	2	Idle					
	3	Idle					
	4	Idle					
	5	Idle					

FIELD	PURPOSE
Index	Displays the RTG channel number The number of RTG channels in the system will always be half the number of MPS channels installed in the system
Status	Displays the current busy / idle status of the port
Destination	Displays telephone number, IP address, and RTP port the RTG channel is connected to
Codec	Displays the audio codec the RTG channel is using
Tone Type	Displays the type of service being provided by the RTG channel. 6 = Ringback tone 9 = Hold TONE Music = Music on Hold

4.7 Multicast Paging Support

GENERAL DESCRIPTION

With today's explosive growth of IP telephone usage in businesses it has become even more necessary to control the load on the data networks that support those IP phones. Samsung is addressing that need in version 4.60 by adding the ability to page to IP phones through **multicast** data packets. This means that instead of sending a separate data stream (and assigning a separate **MGI** channel) to each IP phone receiving the page, the system can send only one stream for all phones and use only one **MGI** channel. This not only reduces the load on the data network during a page, but may also reduce the number of **OAS** or **MGI64** cards or **MGI** licenses needed in the system.

NOTE: Multicast paging feature applies to SMT-I IP phones only on the same local network as the OfficeServ 7000 system. Remote IP phones will still require separate MGI channels for each remote IP phone being paged, unless the router at the remote location can support the multicast feature. Many routers can support multicast.

PROGRAMMING

Two Device Manager Menus have been edited and one has been created in order to support multicasting. The new menu is **5.2.25 Multicast Page IP List** and the edited menus are **2.7.1 ITP Information** and **4.1.3 Page Groups**.

2.7.1 ITP Information

This menu is used to configure multicast options for Samsung **SMT-i** Series IP phones.

2.7.1.ITP Information								
Tel Number	Type	Time Zone	Signal Type	Video Codec	Video Size	QoS Enable	USE sRTP	Multicast Page
2220		+00 00	UDP	H.263	CIF	Disable	Disable	Auto
2221		+00 00	UDP	H.263	CIF	Disable	Disable	Auto
2222		+00 00	UDP	H.263	CIF	Disable	Disable	Auto
2223		+00 00	UDP	H.263	CIF	Disable	Disable	Auto
2224		+00 00	UDP	H.263	CIF	Disable	Disable	Auto

NEW FIELD	PURPOSE
Multicast Page	Sets whether an IP device will use multicast paging (ON), use unicast paging (OFF), or automatically determine usage based on the device's registered IP address (AUTO). The default setting is AUTO .

5.2.25 Multicast Page IP List

This menu is used to configure up to **80** remote router IP **segments** or **addresses** that the system can **multicast** to.

5.2.25.Multicast Page IP List	
Index	Multicast Page IP List
1	0.0.0.0
2	0.0.0.0
3	0.0.0.0
4	0.0.0.0
5	0.0.0.0
6	0.0.0.0
7	0.0.0.0
8	0.0.0.0
9	0.0.0.0
10	0.0.0.0
...	...

FIELD	PURPOSE
Multicast Page IP List	Sets an IP segment or address that will accept multicast packets from the system. There is no need to enter any address if there is no remote router that support multicast. You can enter .255 to cover all ranges in the subnet.

4.1.3 Page Groups

This menu is used to configure **internal** and **external** page groups and the **multicast** address **internal** page groups should stream page announcements to, if any.

4.1.3.Page Groups				
Member	Zone 0	Zone 1	Zone 2	Zone 3
Multicast Addr	239.0.0.1	255.255.255.255	255.255.255.255	255.255.255.255
1	2200			
2	2201			
3	2202			
4	2203			

NEW FIELD	PURPOSE
Multicast Addr	Sets the broadcast IP address the internal page group will use to stream multicast packets to the IP phones in the page group. The default value of 255.255.255.255 means that no multicast will be used for this page group. The valid range of multicast addresses is 224.0.1.0 through 239.255.255.254.

4.8 Plug-N-Play

GENERAL DESCRIPTION

For companies with a large amount of IP telephones a significant number of man hours can be spent setting IP addresses, updating software, and registering phones. This directly affects a company's ability to stay efficient and keep costs down. To help alleviate many of the common time sinks involved with installing IP phones Samsung has developed a new **Plug-N-Play** feature for the **OfficeServ 7000 Series** and **OfficeServ SMT-i Series IP Phones**. This feature, enabled by version 4.60 system software and the latest IP phone software, allows SMT-i Series phones to find the OfficeServ 7000 Series system automatically and register with very minimal programming. Version 4.60 adds the ability to set the OfficeServ 7000 Series system as a **DHCP server** (*for OfficeServ 7030, 7100, and 7200-S only*) and to specify **how to register IP phones**.

Version 4.60 allows **SMT-i Series** IP phones to register in one of three ways:

- **ID/Password Registration (Normal Login)**

This is the normal registration method used by OfficeServ systems prior to version 4.60 and for ITP Series IP Phones, OfficeServ Softphones, and OfficeServ Communicator Softphones

- **MAC Address Registration (Pre-MAC Address)**

- This mode allows the technician to set which extension number corresponds to which IP Phone MAC Address so upon connecting to the system it can be assigned the correct station registration. **New feature: Auto Registration (Auto PNP)**

This mode, which is the system default, allows phones to register without any user or technician action at all. Each time an SMT-i Series IP phone connects to the system the MAC address will automatically be assigned to the next available IP extension number in sequence.

Both the **MAC Address** and **Auto Registration** modes require custom **DHCP flags** to be sent to the **SMT-i Series IP phones** when it is assigned an IP address. These **DHCP** settings are automatically configured when an **OfficeServ 7030, 7100, or 7200-S** is set to operate as a **DHCP server**, but the same settings can be configured for sites with an **OfficeServ 7200 or 7400** and a customer-provided **DHCP server** already installed.

Note: **PNP is available for SMT-I series of phones only. It is not available on SMT-W5120 or ITP model.**

PROGRAMMING

A single Device Manager menu has been changed to support the Plug-N-Play feature, menu **5.2.10 System IP Options**, which is used to configure various IP Phone connection and registration options. In addition, the **SMT-i Series phones** can now recognize **DHCP options 66** and **128**. Configuration of a **DHCP server** is discussed below.

Configuring a Customer-Provided DHCP Server

In order to configure a customer-provided DHCP Server there are two options that must be configured. It is not possible to give specific instructions on how to implement these two options as every DHCP Server's configuration is different, but the DHCP option numbers are industry-standard, which should aid in finding the specifics for the server in use.

Option 66 – TFTP Server Name

This option tells the **DHCP server** to respond to requests sent from specific host names. In the case of the **SMT-i Series** phones this value should be set to "**SEC_ITP**".

Option 128 – TFTP Server IP

After receiving an **option 66** request the **DHCP server** will use **option 128** to send out the **IP address** of the server the requesting host should connect to. This value should be set to the **IP address of the OfficeServ 7000 Series system**.

Note: IP phone needs to be to PNP mode when connecting to the OfficeServ system with PNP or pre-MAC setting.

Auto PNP

5.2.10 System IP Options

This menu is used to configure various options relating to IP phones registration and communications.

5.2.10. System IP Options			FIELD	PURPOSE
Item		Value	DHCP Server Use	Sets whether or not the OfficeServ will be used as a DHCP Server Available only on OfficeServ 7030 / 7100 / 7200-S
ITP Max TX Limit	Type	MMC Command		
	Start Time (Hour)	22		
ITP Idle Logout	Start Time (Min)	22		
	Frame Count	40ms	Start Address	Sets the start IP address of the DHCP pool Must be the same as the OfficeServ system subnet range
WIP DSP Parameter	Echo Cancel	Enable		
	Use	Enable		
DHCP Server	Start Address	192.168.10		
	End Address	192.168.100	End Address	Sets the final IP address of the DHCP pool
PNP Mode		Auto PNP		
			PNP Mode	Sets the Plug-N-Play registration mode Auto PNP, pre-MAC address, or normal login

MAC Address Registration

Set DM 5.2.10 PNP Mode to Pre-Mac and enter the IP phone MAC address to the user ID section of DM 2.7.1. Alphabet character of MAC address has to be in capital letter.

2.7.1. ITP Information			
Tel Number	User ID	Password	DSP Type
2697	00163282BF20	1234	G.711
2698	00163282A850	1234	G.711
2699	2699	1234	G.711

4.9 MOBEX Enhancements

GENERAL DESCRIPTION

In 2009 Samsung launched version 4.30 system software for the OfficeServ 7000 Series that added the **MOBEX** feature. Since then there has been overwhelmingly positive feedback about this feature and with version 4.60 we have enhanced it even further:

- **MOBEX Scheduling**

Allows a user to set the hours during which **MOBEX** is active. Up to **three periods** can be set **per day of the week**. As an example, a user can ensure that they do not receive **MOBEX** calls during lunch, when driving home, on weekends, or between the weekday hours of 9pm and 7am.

- **MOBEX Targeting**

Allows a user to set which **types of calls** will make it to their MOBEX phone. Users can specify whether **intercom callers**, **trunk callers**, or **SPNet callers** will reach their **MOBEX** phone. They can also determine whether or not calls to **Station Groups** they are a member of will ring to their **MOBEX** phone.

- **Executive MOBEX Callback**

The downside of the **Executive MOBEX** feature is that sometimes it is a long distance call to get into the system, so toll charges can be incurred just to make a local call through the system. Version 4.60 allows an **Executive MOBEX User** to be set so that when they call in to the system it immediately hangs up on them and then calls them back. When they answer they will hear system dial tone and are then able to dial out as normal. This ensures that any **toll charges** for using **Executive MOBEX** call go to the system trunk lines instead of the cell phone. Also added are a **timer** to set how long the system should wait after disconnecting to call back to the **Executive MOBEX** phone and a **counter** to determine how many times the callback should be attempted before aborting.

- **MOBEX Busy**

For heavy **MOBEX** users it is common that while speaking on their **MOBEX cell phone** at their desk a second call rings in to their **desk phone**. In prior versions of software this was unavoidable, but version 4.60 adds the option for the system to see both the **MOBEX extension** and the **paired desk phone** as **busy** when either device is in use, much the way that **Station Pairs** work in the system.

Note: Executive Mobex users can activate or deactivate Mobex feature already supported

PROGRAMMING

Three Device Manager Menus have been modified and two have been created to support the new MOBEX enhancements. **4.10.1 Mobex Scheduling Time** and **5.15.16 Mobex Caller** are the new menus. The changed menus are **2.7.5 Mobile Extension**, **4.2.5 Ring Group Pair**, and **5.14.3 Outgoing/Retry Options**.

2.7.5 Mobile Extension

This menu is used to configure **Mobile Extension** and **Executive MOBEX** ports.

2.7.5.Mobile Extension					
Tel Number	User	MVS License Priority	License Ma	Callback	AA
2260			0	No	No
2261			0	No	No
2262			0	No	No

FIELD	PURPOSE
Callback	Turns Executive MOBEX Callback on or off for the MOBEX station.

4.2.5 Ring Group Pair

This menu is used to configure OfficeServ Connect ring groups.

4.2.5.Ring Group Pair					
Master Station	Member			MOBEX Member Ring	MOBEX Ring Group Busy
2210	3	4	5	Enable	Disable
2211				Enable	Disable

FIELD	PURPOSE
MOBEX Ring Group Busy	When Enabled every device in the OfficeServ Connect group will be considered busy when any member device is on a call.

4.10.1 Mobex Scheduling Time

This menu is used to set up an activity schedule for each station with an OfficeServ Connect group.

4.10.1.Mobex Scheduling Time										
Tel Number		2200								
		Mobex Scheduling 1				Mobex Scheduling 2				Mobex S
		Start Time		End Time		Start Time		End Time		Start Time
		Hour	Min	Hour	Min	Hour	Min	Hour	Min	Hour
Mobex Scheduling Time	SUN									
	MON									
	TUE									
	WED									
	THU									
	FRI									
	SAT									

5.14.3 Outgoing/Retry Options

This menu sets various timers or counters relating to outbound calls made by the system.

5.14.3.Outgoing/Retry Options	
Item	Value
Dial Pass Time (sec)	3
New Call Count	99
Auto Redial Count	5
Auto Redial Interval (sec)	30
Auto Redial Release (sec)	45
Mobile Callback Retry Count	5
Mobile Callback Time (sec)	5

FIELD	PURPOSE
Mobile Callback Retry Count	Sets the number of times the Executive MOBEX Callback feature will attempt to call the user back
Mobile Callback Time (sec)	Sets the amount of time the system will wait before making the initial Executive MOBEX Callback as well as the time made between callback attempts

5.15.16 Mobex Caller(Targeting)

This menu is used to determine **which types** of callers will be able to reach a member at their **MOBEX** station.

5.15.16.Mobex Caller						
Tel Number	From stn to stn	From stn to sgp	From trk to stn	From trk to sgp	From spnet to stn	From spnet to sgp
2210	On	Off	On	Off	On	Off
2211	On	Off	On	Off	On	Off

FIELD	PURPOSE
From stn to stn	Allows or denies calls from another station to reach the MOBEX station when calling the MOBEX user's extension
From stn to sgp	Allows or denies calls from another station to reach the MOBEX station when calling a station group the MOBEX user's extension is a member of
From trk to stn	Allows or denies calls from a CO trunk to reach the MOBEX station when calling the MOBEX user's extension
From trk to sgp	Allows or denies calls from a CO trunk to reach the MOBEX station when calling a station group the MOBEX user's extension is a member of
From spnet to stn	Allows or denies calls from another SPNet node to reach the MOBEX station when calling the MOBEX user's extension
From spnet to sgp	Allows or denies calls from another SPNet node to reach the MOBEX station when calling a station group the MOBEX user's extension is a member of

USER INSTRUCTIONS

To set a MOBEX Schedule:

- Press **TRANSFER** plus **129**
- Press **VOLUME UP** or **DOWN** to select the desired day of the week
- Press the **RIGHT SOFTKEY** twice
- Use the keypad to enter the 4-digit hour and minute to turn MOBEX on (i.e. **0730**)
- Use the keypad to enter the 4-digit hour and minute to turn MOBEX off (i.e. **1700**)
- Press **TRANSFER** to save your changes and exit

4.10 SVM Prompt File Uploading

GENERAL DESCRIPTION

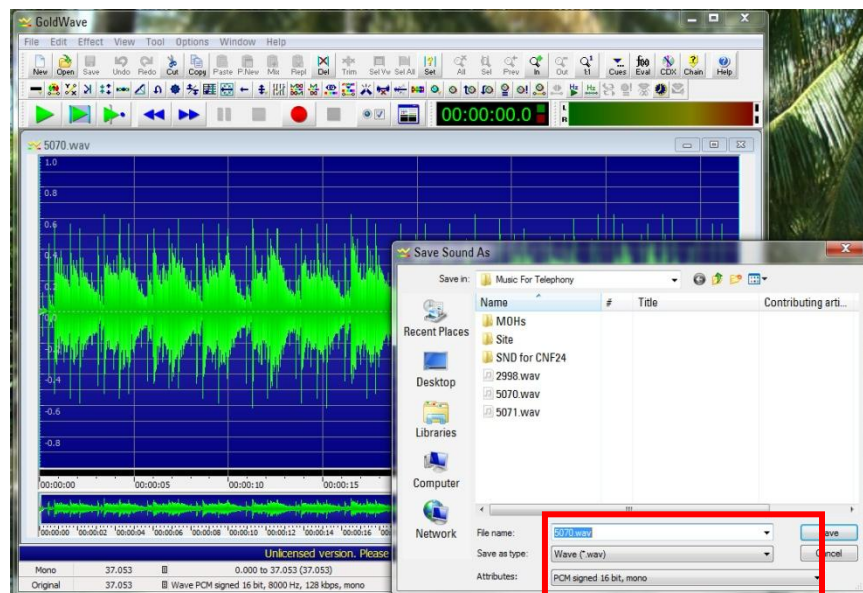

The Samsung voicemail (SVM) has been enhanced to automatically convert the format of uploaded audio **WAV** files to the voicemail system. If the administrator uploads an existing **WAV** file using the SVM voice studio, the voice mail application will automatically convert the WAV file to the format required for the SVM. This enhancement is applied to the OfficeServ 7030, 7100 (MP10a), and 7200-S systems.

Notes:

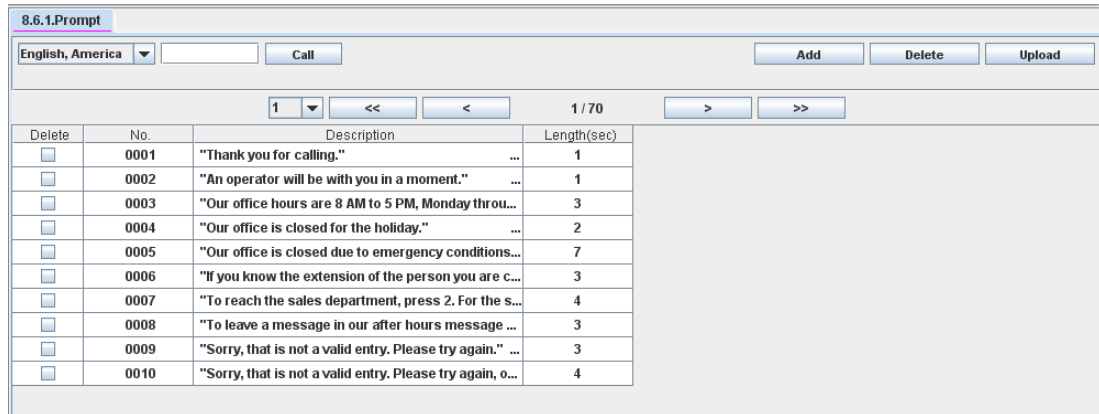

1. Wav file prompt conversion is supported on the OS 7030, 7100, 7200-S with 4.60 software.
2. This enhancement is not supported on the 7200 and 7400 with the SVMi20E installed.
3. The SVM only supports one wav file format (8kHz, mono, 16 bit signed, 128kps).

PROGRAMMING

When using an application such as this example (GoldWave) to record audio prompt in to a wav format, the store audio prompt file can then be automatically converted to a useable format and uploaded directly into the SVM application using the embedded voice studio. Make sure to save the file as WAV (8kHz, Mono, 16 bit signed, 128kps).

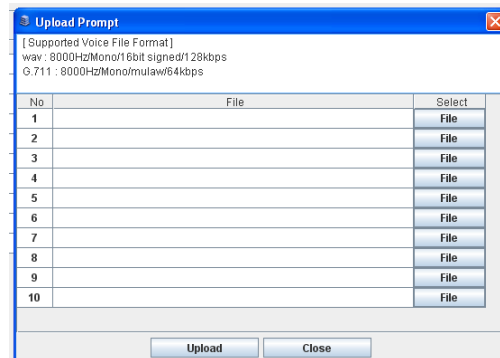

Once the audio file is stored in a wav format, use **Device Manager to access the VM/AA function and go to voice studio menu 8.6, prompts 8.6.1.** In this screen, press the upload button to select the location of the wav file to be uploaded and converted.

Delete	No.	Description	Length(sec)
<input type="checkbox"/>	0001	"Thank you for calling." ...	1
<input type="checkbox"/>	0002	"An operator will be with you in a moment." ...	1
<input type="checkbox"/>	0003	"Our office hours are 8 AM to 5 PM, Monday throu..."	3
<input type="checkbox"/>	0004	"Our office is closed for the holiday." ...	2
<input type="checkbox"/>	0005	"Our office is closed due to emergency conditions..."	7
<input type="checkbox"/>	0006	"If you know the extension of the person you are c..."	3
<input type="checkbox"/>	0007	"To reach the sales department, press 2. For the s..."	4
<input type="checkbox"/>	0008	"To leave a message in our after hours message ..."	3
<input type="checkbox"/>	0009	"Sorry, that is not a valid entry. Please try again." ...	3
<input type="checkbox"/>	0010	"Sorry, that is not a valid entry. Please try again, o..."	4

Next select the location of the wav file to be converted and uploaded, then click on upload at the bottom of the screen. See the example below.

No	File	Select
1		File
2		File
3		File
4		File

7		File
8		File
9		File
10		File

4.11 NTP Server Support

GENERAL DESCRIPTION

Due to overwhelming demand from the customer base Samsung has added the ability in version 4.60 software for the OfficeServ 7000 Series systems to synchronize the **internal system clock** with a **Network Time Protocol (NTP) Server**. This means that the system will automatically monitor its own internal clock so that customers do not need to worry about drifting clocks or resetting them after power outages or Daylight Savings Time changes. **NTP Servers** can be entered as a **static IP address** or as a **DNS name** if the system **DNS Server** options have been set.

PROGRAMMING

Two Device Manager Menus have been changed to support NTP synchronization: **2.1.3 System Time** and **5.6.1 System I/O Parameter**.

2.1.3 System Time

This menu is used to configure the system date and time, as well as the start and end dates of Daylight Savings Time each year.

2.1.3. System Time			
Item	Year	Month	Date
Current Time	2011	12	14
Daylight Saving Time			
1	2052		
2	2056	0	0
3	2083		
4	2071	0	0
5	2000	0	0
6	2000		
7	2000	0	0
8	2000	0	0
9	2000	0	0
10	2000	0	0
System Time Option			
Auto Update ISDN Time	Off		
NTP Option			
System Time Zone	+00 00		
NTP Server URL			

FIELD	PURPOSE
System Time Zone	Sets the time zone of the system based on the offset from Greenwich Mean Time (GMT)
NTP Server URL	Sets the web address (or URL , for example us.pool.ntp.org) of the Network Time (NTP) server the system should synchronize the internal clock to

5.6.1 System I/O Parameter

This menu is used to set various options relating to application connectivity to the system.

5.6.1. System I/O Parameter		
Item	IP Address	Value
DNS Server	IP Address 1	192.168.9.101
	IP Address 2	4.2.2.2

FIELD	PURPOSE
DNS Server IP Address 1 ~ 2	Sets the primary (for example 208.67.222.222) and alternate servers to use for DNS queries . This allows the system to resolve a DNS name , such as www.samsung.com , to a physical IP address.

4.12 Phone Book Download for SMT-i Phones

GENERAL DESCRIPTION

The new **System Phone Book** feature allows up to **100 phone numbers and names** to be stored in the system where they can be pushed to the phonebook entries of **SMT-i phones**. This eliminates the work of creating separate company phonebooks for each employee.**4.4.2 Phone Book**

This menu is used to set up the system phone book that can be pushed to **SMT-I series phones**.

4.4.2.Phone Book			
Update	Yes		
Download Public Port	80		
Index	Phone Number	Phone Name	Phone Type
1	3201	Joel	Product
2	3210	Chris	Sales
3	3220	Vivian	Marketing
4			

FIELD	PURPOSE
Update	Set to Yes to push the updated phonebook to all connected SMT-I phones .
Download Public Port	Sets the HTTP port the system will use to download the phonebook to the remote location on the public network. System use HTTP port 80 for the local SMT-I phones.
Phone Number	Sets the phonebook entry's phone number
Phone Name	Sets the name to associate with the phonebook entry's phone number
Phone Type	Sets the phone book category to associate with the phonebook entry's phone number (such as " Sales " or " Marketing ")

4.13 Presence Awareness Enhancements

GENERAL DESCRIPTION

Since the early days of the Samsung Business Communications feature package there has been a feature called **Programmed Messages**. **Programmed Messages** allow a user to set a status message on their phone display that will show up in the display of any intercom caller who dials them. This is ideal for situations where a manager must go to a meeting, for example, because they can set their **Programmed Message** to “**IN A MEETING**” and any time someone else in the office tries to dial them the message will alert the caller that the manager is in a meeting.

With version 4.60 Samsung, with the assistance of dealers like you, has revisited the usefulness of the **Programmed Message** feature and expanded it to become an even more robust component of the OfficeServ 7000 Series’ built-in presence awareness feature by adding the ability to specify **actions** that will occur along with the **Programmed Message** as well as what **cadence** the **LED** of the programmable button assigned to the message will show.

The available actions to take when a **Programmed Message** is activated are: **Set DND without Forward**, **Set DND with Forward**, **Set Forward All**, **Clear DND + FWD All**, or **None** (do nothing). Available **LED** cadences are **Steady**, **Flashing**, or **Off**.

This allows a user to, for example, have a button labeled **Vacation** that when pressed changes their **Programmed Message** to say “**ON VACATION**” and set **Forward All to voicemail**, or a button labeled **On Call** that, when pressed, changes their **Programmed Message** to “**ON THE ROAD**” and sets **DND with forwarding** to their cell phone.

PROGRAMMING

Two Device Manager Menus have been changed to support the new Programmed Message features: **5.13.3 Programmed Message** and **5.15.9 User Programmed Message**.

5.13.3 Programmed Message

This menu is used to configure system-wide **Programmed Messages**.

5.13.3.Programmed Message					
Index	Message	Action	Destination		LED Cadence
			T/S No	Outgoing Digit	
1	IN A MEETING	Clear DND + FWD ALL			Off
2	OUT ON A CALL	Set DND with Forward	5249		Steady
3	OUT TO LUNCH	Set Forward All	5249		Steady
4	LEAVE A MESSAGE	Set DND without Forward			Steady

FIELD	PURPOSE
Action	Sets what action will take place when this Programmed Message is activated . By default all Programmed Messages have an action of None .
Destination T/S No	Set the local trunk , station , trunk group , or station group that the station will forward to according to the chosen Action .
Destination Outgoing Digit	Set the external number to forward to if the chosen Action should forward externally .
LED Cadence	Sets the cadence of the LED when the Programmed Message button is activated . When deactivated the LED will always be off .

5.15.9 User Programmed Message

This menu is used to configure user-specific **Programmed Messages**.

5.15.9.User Programmed Message					
Tel Number		1000			
Select MSG No		0			
Index	Message	Action	Destination		LED Cadence
			T/S No	Outgoing Digit	
16	Blank Message	None			Steady
17	Blank Message	None			Steady

FIELD	PURPOSE
Action	Sets what action will take place when this Programmed Message is activated . By default all Programmed Messages have an action of None .
Destination T/S No	Set the local trunk , station , trunk group , or station group that the station will forward to according to the chosen Action .
Destination Outgoing Digit	Set the external number to forward to if the chosen Action should forward externally .
LED Cadence	Sets the cadence of the LED when the Programmed Message button is activated . When deactivated the LED will always be off .

USER INSTRUCTIONS

When you will be away from your phone for any length of time, you can leave a programmed station message. Display stations calling you will see this message and be informed of your status or follow your instructions. In addition you can assign any of four possible actions to be taken on your station when you activate the programmed message. These actions are:

- DND W/FWD** – Sets Do Not Disturb (**DND**) on your station and forwards all calls to another station or to voicemail.
- DNDW/OFWD** – Sets **DND** on your station but does not forward calls; callers will receive a fast busy tone when calling to your station.
- FWD ALL** – Sets **Forward All** on your station so that all incoming callers will be immediately forwarded to another station or to your voicemail.
- CLEARBOTH** – Clears both **DND** and **Forward All** from your station. This is typically used when the programmed message is telling your callers that you are at your desk and available.

To set an action to take place along with a programmed message:

- Press **TRANSFER** plus **115**.
- Dial any of the message codes (**16-20**) listed on the back of your user guide.
NOTE: Actions may only be set for the user-customizable messages numbered 16 through 20.
- Use the keypad to enter a message to show to display stations calling you.
- Press the **RIGHT SOFTKEY** to save the message.
- Press **VOLUME UP** or **DOWN** to select the desired action.
- Press the **RIGHT SOFTKEY** to save the action.
- If the desired action requires you to set a forwarding location, such as another station or your voicemail box, dial that destination and press the **RIGHT SOFTKEY** to save the destination.
- Press **VOLUME UP** or **DOWN** to set how the button light should appear (**STEADY**, **FLASHING**, or **OFF**) on any programmed message (**PMSG**) buttons that use this programmed message.
- Press **TRANSFER** to exit and save your changes.

To activate a programmed station message:

- Dial **48** plus any of the message codes (**01-20**) listed on the back of your user guide.
- To cancel any of these messages you might have selected, dial **48** plus **00**.

NOTE: If the Hot Keypad feature has been turned off, you must first lift the handset or press the SPEAKER key.

You can have multiple programmed message keys (**PMSG**) and each one can have a different message code and action:

- Press any programmed message (**PMSG**) button. The message is set, any assigned action will take effect, and the button will light according to the setting assigned to the chosen programmed message.
- Pressing an active programmed message (**PMSG**) button again will turn the programmed message off.
- Pressing another programmed message (**PMSG**) button will turn the previous one off and set the new programmed message.

4.14 DTMF Support on SIP Stations

GENERAL DESCRIPTION

Version 4.60 system software enhances **third-party SIP phones** connected to the system by allowing them to receive **DTMF** digits during a call and by allowing them to utilize the **H.264** codec to provide video during calls.

DTMF digits can be sent to the phone by either of two protocols: **RFC2833**, which is an **in-band DTMF** delivery method, or by **INFO**, which is a special **out-of-band** method in the **SIP** protocol. This is particularly useful for certain types of **third-party SIP** voicemail systems, door phones, and other third party devices that require **DTMF** digits to activate.

PROGRAMMING

One Device Manager Menu, **2.7.2 SIP Phone Information** has been edited to support the **DTMF** sending options.

2.7.2 SIP Phone Information

This menu is used to configure options for specific **3rd-Party SIP Stations**.

2.7.2.SIP Phone Information				
Tel Number	Tone Source	Call Waiting	Unregistered FWD	DTMF Type
2250	System Tone	Disable		RFC2833
2251	System Tone	Disable		RFC2833

FIELD	PURPOSE
DTMF Type	Sets the DTMF protocol to use for the 3rd-Party SIP Station .

NOTE: 3rd Party SIP video phone is not supported in North America.

4.15 MP Enhancements

GENERAL DESCRIPTION

The version 4.60 feature package also includes some new convenience features to assist in troubleshooting and system installation.

The new **SMDR Buffering** feature allows up to **10,000 SMDR records** to be stored in **RAM** in the event that the call accounting package, billing system or printer that gathers **SMDR data** loses connection from the system. When the device reconnects the buffered **SMDR data** are sent immediately.

A new **Alarm Email** feature allows **system alarms** and **crash reports** to be **automatically emailed** to **up to four** system administrators, managers, or necessary personnel. Emails can be sent immediately **when an error occurs**, or they can be buffered and sent **on demand** or **daily**.

PROGRAMMING

One Device Manager Menu, **5.6.2 LAN Printer**, has been changed to support the **SMDR Buffering** feature. Two new Device Manager Menus, **6.1.4 System Alarm Mail Server Info** and **6.1.5 System Alarm Email Address**, have been created to support the **Alarm Email** feature. One Device Manager Menu, **4.4.2 Phone Book**, has been created to support the **System Phone Book** feature.

5.6.2 LAN Printer

This menu is used to configure the various data output streams the **OfficeServ 7000 Series** offers.

5.6.2 LAN Printer	
Data Type	SMDR
Current Status	Off
Buffered Data Printout	No
Update to LAN Card	No

FIELD	PURPOSE
Buffered Data Printout	Sets whether the system should buffer the data stream in memory in the event the connected device loses connection. Up to 10,000 records will be buffered.

4.15.1 ALARM NOTIFICATION [Future Release]

6.1.4 System Alarm Mail Server Info

This menu is used to configure the connection to the email server where alarm email notifications are sent.

6.1.5.System Alarm Email Address		6.1.4.System Alarm Mail Server Info	
Item		Mail Server Information	
Host ID		105.52.12.200	
Host Port		587	
User ID		ctaylor@sta.samsung.com	
User Password		*****	
Local Domain		www.7400test.com	
Mail Max Retry		3	
Mail Retry Interval		1	
Mail Day Saving Time		Enable	
System Time Zone (GMT)		Not Use	
Send Hour		9	
Send Min		0	
Send Day		Daily	
Send Major Alarm Immediately		On	

FIELD	PURPOSE
Host ID	Sets the IP address or DNS name of the mail server
Host Port	Sets the TCP port to use to talk to the mail server (typically port 25)
User ID	Sets the login ID , if any, used to log in to the mail server
User Password	Sets the password for the above User ID
Local Domain	Sets the domain name to use when logging in to the mail server, if necessary
Mail Max Retry	Set the number of times the system will attempt to resend the message upon failure
Mail Retry Interval	Sets the time to wait between retry attempts
Mail Day Saving Time	Determine if the system will adjust the email time stamp for Daylight Savings Time or not
System Time Zone (GMT)	Sets the time zone of the system based on the offset from Greenwich Mean Time (GMT)
Send Hour / Send Min	Sets the time of day alarm emails should be sent
Send Day	Sets whether emails should send daily or only on demand
Send Major Alarm Immediately	Determine if major alarms will generate an email immediately or if they will be sent along with the normally scheduled report

6.1.5 System Alarm Email Address

This menu is used to configure the email address(es) alarm emails will be sent to.

6.1.5.System Alarm Email Address		6.1.4.System Alarm Mail Server Info
Item		Value
Reply Email Address		ctaylor@sta.samsung.com
Send Email Address	1	ctaylor0711@gmail.com
	2	clifton_tylr@yahoo.com
	3	
	4	

FIELD	PURPOSE
Reply Email Address	Sets the "from" address of the alarm email
Send Email Address 1~ 4	Sets up to four email addresses the alarm email will be sent to

4.16 DID Max Calls Per Ring Plan

GENERAL DESCRIPTION

The OfficeServ 7000 Series has always had the ability to restrict the maximum number of simultaneous calls that can be received on a **DID** number. This has been modified in version 4.60 by allowing each **DID** to have a separate **Maximum Call Count** for each **Ring Plan**. This means that companies can have a much greater degree of control over how their **DID** numbers are used. As an example, a call center agent's personal **DID** number might accept only one call during normal business hours, but three calls at lunch or after hours.

PROGRAMMING

One Device Manager Menu, **3.2.3 DID Ringing**, has been changed to support the new **Max Calls** per **Ring Plan**.

3.2.3 DID Ringing

This menu is used to configure **DID** numbers for **SIP**, **SPNet**, and **PRI** trunks.

3.2.3.DID Ringing							
Entry No	Ring Plan 1		Ring Plan 2		Ring Plan 3		Ring Plan 4
	Ring Port	Max Count	Ring Port	Max Count	Ring Port	Max Count	
4	5249	99	5203	99	5203	99	5203
5	2240	99	2240	99	2240	99	2240

FIELD	PURPOSE
Ring Plan 1 ~ 6 Max Count	Sets the maximum number of simultaneous calls for the DID number during the specific Ring Plan .

4.17 Max Calls in Queue Feature

GENERAL DESCRIPTION

In order to keep pace with the rapidly evolving needs of small call centers a new feature has been added to version 4.60 software that allows the number of waiting calls for a **UCD Group** to be capped at a **desired limit**. Any calls above this maximum threshold will be automatically rerouted to a **predefined destination**. This allows a call center manager to, for example, have the call center configured so that a maximum of 4 calls may be in queue, and any calls beyond that go immediately to a voicemail box.

PROGRAMMING

The **4.6.1 UCD Group Options** Device Manager Menu has been changed to allow the new maximum call limit.

4.6.1 UCD Group Options

This menu is used to configure **Call Center Groups** and their options.

4.6.1.UCD Group Options		
Group Number	5202	5203
Group Index	2	3
Final Dest	5249	5249
Wrap Time (sec)	4	10
Next Time (sec)	15	6
Recall Time (sec)	250	45
Auto Logout	On	Off
All Out To Final	On	On
Group Busy Next	On	On
MOH/BGM	3280	3280
Auto Clear	No	No
Clear Time	Hour	
	Min	
Auto Print	No	No
Print Time	Hour	
	Min	
Agent ID	88	88
Limit Count	5	99
Limit Destination	5249	

FIELD	PURPOSE
Limit Count	Sets the maximum number of calls that can be queued for a UCD Group before forwarding to Limit Destination .
Limit Destination	Sets the destination station or station group that calls ringing to a UCD group after the Limit Count has been reached will forward to.

4.18 Security Enhancements

GENERAL DESCRIPTION

Each model of the OfficeServ 7000 Series system family contains an embedded web server that is used for the Device Manager and, in the case of the OfficeServ 7030 / 7100 / 7200-S, the embedded voicemail programming interface. Since the last release of software there have been a number of security and performance patches released for the **Apache** web server and **PHP** engine used. With version 4.60 these packages have been updated to the latest versions (as of the date of this document) to ensure the highest level of performance and security.

There are no programming or installation steps to take in order to gain the advantages of these new packages; they are automatically updated and launched when a system boots on version 4.60.

4.19 SIP Trunk Enhancements

GENERAL DESCRIPTION

Version 4.60 adds several enhancements to **SIP trunk** usage:

- **Specify which and how many SIP Trunks can be used for which SIP Carrier**

In prior versions of software all **licensed SIP trunks** were seen as one large pool for incoming calls, and it was not possible to determine how many trunks could be reserved for incoming calls on which service. Version 4.60 changes this by adding the ability to specify the **maximum number** of **SIP trunks** that can be used for incoming calls for each **SIP Carrier** and how many can be used for **SIP Peering**.

- **Segregate SIP Carrier trunk calls from SIP Peer trunk calls**

In addition to the segregation of inbound **SIP Carrier** traffic, version 4.60 also enhances system **Trunk Groups** by adding a field to **SIP Trunk Groups** that determines which **SIP Carrier** can use the **Trunk Group** or if it is used for **SIP Peering**. This ensures a greater level of control over **SIP trunks** for outbound calls and call accounting by assigning which specific trunks are used for which service.

- **Voice Band Data (VBD) support for Fax-over-IP (FoIP)**

Many of the error correction techniques used in **VoIP** processing are designed to ensure that voice data sounds as good as possible. As **VoIP** use is increasing more and more **Fax machines** and **data modems** are being connected to **SIP** lines and becoming subject to these same error correction techniques. This can be quite devastating to **fax** and **modem** transmissions, however, so in version 4.60 it is now possible for **MGIs** to use the **Voice Band Data (VBD)** protocol. The **VBD** protocol disables **NLP** and **Jitter Buffer** processing to ensure that data transmissions (like **fax** or **modem** data) are not distorted.

- **Outgoing Caller ID blocking for SIP Trunks**

With version 4.60 software it is now possible to block outgoing **Caller ID** on **SIP Carrier** or **SIP Peer** trunks. The option is also provided to allow blocking of the OfficeServ 7000 Series system **host ID** as well. If **Caller ID** is disabled the **SIP Carrier** or **SIP Peer** will receive a **CID** packet in the form of `<anonymous@[OfficeServ Public IP Address]>`. If the **host ID** is hidden as well the **CID** packet sent will show `<anonymous@anonymous.invalid>`.

NOTE: *Many SIP Carriers do not support hiding the host ID. Be sure to check with the SIP Carrier before enabling host ID masking.*

- **Tandem trunking for SIP Peers**

Prior to version 4.60 it was not possible to disable **tandem trunking** with **SIP Peer** trunks. Version 4.60 changes this by adding an option to enable or disable **tandem trunking**, which is the ability for an **incoming** call on a **SIP Peer trunk** to be connected to an **outgoing SIP Carrier** or **SIP Peer** trunk, on **SIP Peer** trunks.

- **SIP Trunk Error Alarm**

A new series of alarm indications have been added to version 4.60 relating to **SIP Trunks**. Any time a **SIP trunk** registers or loses registration it will now be logged in the system, as will any resource or allocation errors relating to **SIP Trunks**.

- **Specify how the system should respond to unknown SIP traffic**

Prior to version 4.60 the only way to ignore **SIP traffic** from unknown sources was to send a reject message. This lets a hacker know that the system exists, however, and can lead to an increase in hacker traffic. In version 4.60 it is now possible to determine exactly how the system should respond to incoming SIP traffic from unknown sources.

The new options are

- **No Response(default setting for MP40)**, meaning that the system will **ignore** all SIP messages from unauthorized IP addresses and block the relevant IP address. The OfficeServ system will not send back any response message.
- **Response (default setting for MP03/10a/20s/20)**, which means that the system will not allow SIP calls from unauthorized IP to go through. The OfficeServ system will respond with a deny message (403 forbidden), and
- **None**, which means that the system will **allow** all SIP calls.

- **Specify codec used for SIP Trunks**

Version 4.60 adds the ability to specify the **audio codec** used for **SIP** conversations. Different **codecs** can be chosen for each **SIP Carrier** and each **SIP Peer**. Additionally there are four **codec priority levels** that can be set so that if the desired **codec** cannot be used the next lower priority **codec** will be attempted automatically.

PROGRAMMING

Six Device Manager Menus have been modified to support these new SIP Trunking enhancements: **2.5.1 Station Data**, **4.1.2 Trunk Groups**, **5.2.12 SIP Stack/Ext/Trunk Options**, **5.2.13 SIP Carrier Options**, **5.2.16 MGI Options**, and **5.2.17 VoIP Peering**.

2.5.1 Station Data

This menu is used to configure various options for individual telephones connected to the OfficeServ 7000 Series system.

2.5.1.Station Data			
Tel Number	Group	CLI Receive	CLI Send
2210		Yes	Yes

FIELD	PURPOSE
CLI Send	Sets whether or not this station will send caller ID information when making a CO call. NOTE: This option remains unchanged from prior software, but in version 4.60 it will also affect calls made to SIP Carrier Trunks.

4.1.2 Trunk Groups

This menu is used to configure **Trunk Groups** and their members.

4.1.2.Trunk Groups			
Group Number	8005		8006
Group Index	5		6
Group Type	SIP		SIP
Group Mode	Sequential		Sequential
ISP Selection	Peering		ISP1
	7201		7201

FIELD	PURPOSE
ISP Selection	For Trunk Groups with a Group Type of SIP this value sets which SIP Carrier the Trunk Group will service or if it will be available for SIP Peering , allowing the technician to segregate SIP Carrier and SIP Peering traffic.

5.2.12 SIP Stack/Ext/Trunk Options

This menu is used to set various options relating to how **SIP Stations** and **Trunks** connect to, and communicate with, the system.

5.2.12.SIP Stack/Ext/Trunk Options		
	Item	Value
SIP Trunk Configuration	Default SIP Carrier	1
	IBG Expire Time (sec)	10
	Incoming Mode	Follow DID Translation
	Peer CLI Table	1
	Received CLI Forward Options	Disable
	Comm Exclusive	No Response
	Common MSG Block Timer (Sec)	600
	Register MSG Block Timer (Sec)	60
	Register Retry Limit	4
	SIP Peering Codec PR1	G.729
	SIP Peering Codec PR2	G.711a
	SIP Peering Max Channel	224

FIELD	PURPOSE
Comm Exclusive	<p>Sets the method the OfficeServ 7000 Series system will respond to SIP traffic from unknown sources.</p> <ul style="list-style-type: none"> • No Response (default setting for MP40), meaning that the system will ignore all SIP messages from unauthorized IP addresses and block the relevant IP address. The OfficeServ system will not send back any response message. • Response (default setting for MP03/10a/20s/20), which means that the system will not allow SIP calls from unauthorized IP to go through. The OfficeServ system will respond with a deny message (403 forbidden), and • None, which means that the system will allow all SIP calls. <p>See note below.</p>
SIP Peering Codec PR1 ~ 4	<p>Sets the audio codec prioritization to use when establishing a SIP Peering call. PR1 will be attempted first and if that codec cannot be negotiated PR2 will be attempted, etc.</p>
SIP Peering Max Channel	<p>Sets the maximum number of trunks that can be used simultaneously for inbound or outbound SIP Peering calls. Call attempts beyond this limit will receive a busy signal.</p>

NOTE:

Valid SIP traffics are SIP messages come from known IP addresses. IP addresses come from the following different places are considered valid:

- DM 5.2.13 SIP Carrier Option
 - The IP address in the Outbound Proxy field, or
 - If IP address is used in this field, OfficeServ will accept SIP trunk call from this IP address only. If the SIP provider sends call from other server (different IP addresses), OfficeServ may reject the call depends on the setting of Comm Exclusive.
 - It is not recommended to use IP address in this field. If IP address is used, you need to set Comm Exclusive to None.
 - The resolution of domain name in the Outbound Proxy field
- DM 5.2.17 VoIP Peering
 - IP addresses in this table.

5.2.13 SIP Carrier Options

This menu is used to configure SIP Carrier accounts.

5.2.13.SIP Carrier Options		
SIP Carrier	1	
Item	Value	
SIP Signaling Type	UDP	
E164 Support	Enable	
PRACK Support	Disable	
Hold Mode	Send Only	
Response to Tag	Keep	
SIP Connection Reuse	Disable	
SIP Mutual TLS Enable	Disable	
SIP Validate TLS Certificate	Disable	
SIP Trunking Codec PR1	G.729	
SIP Trunking Codec PR2	G.711a	
SIP Trunking Codec PR3	G.711u	
SIP Trunking Codec PR4	Disable	
SIP Trunking Use Prefs	Disable	
SIP Trunking Max Channel	224	
Outgoing Caller ID Use Prefs	Disable	
Incoming Caller Fixed Codec	Disable	
Anonymous Host Name	Disable	

FIELD	PURPOSE
SIP Trunking Codec PR1 ~ 4	Sets the audio codec prioritization to use when establishing a call for this SIP Carrier . PR1 will be attempted first and if that codec cannot be negotiated PR2 will be attempted, etc.
SIP Trunking Max Channel	Sets the maximum number of trunks that can be used simultaneously for inbound or outbound calls using this SIP Carrier . Call attempts beyond this limit will receive a busy signal.
Anonymous Host Name	When Enabled outbound call for this SIP Carrier will have an anonymous host name, so the Caller ID information sent will be in the form <[stationID]@anonymous.invalid>

5.2.16 MGI Options

This menu is used to configure connection options and set up **MGI** cards and channels.

5.2.16.MGI Options		
Card Type		
Item	Value	
Maximum Jitter (ms)	150	
Jitter Adaptation Period (sec)	1	
Jitter Adaptation Threshold (ms)	200	
Fax Option	VBD	
Fax Redundancy	2	

FIELD	PURPOSE
Fax Option	Determine whether FoIP calls will use T.38 , Pass Through , or the new VBD protocol.

5.2.17 VoIP Peering

This menu is used to create and configure **SIP Peering** connections to third-party devices or phone systems.

5.2.17.VoIP Peering					
Table No	Type	SIP Response to Tag	SIP Connection Reuse	VoIP Tandem	SIP Coi
0	Keep	Disable	Disable	Enable	
1	Keep	Disable	Disable	Enable	

FIELD	PURPOSE
VoIP Tandem	Set whether or not incoming calls from this SIP Peer can be routed out to local analog , PRI , or SIP Carrier trunks

4.20 Malicious Call Restriction

GENERAL DESCRIPTION

The Malicious Call Restriction feature has been added to software version 4.60 and is used to protect the OfficeServ system against fraudulent SIP calls.

By enabling this feature you can prevent unauthorized SIP calls going through the system via the SIP trunk or SIP peering. The OfficeServ system blocks the IP address when a SIP phone tries to register to the system with a wrong User ID or Password.

The system will recognize the following IP list as valid:

1. Registered SIP station IP address (Device Manager 6.2.3)
2. VoIP peering IP addresses (Device Manager 5.2.17)
3. Carrier's IP addresses (Device Manager 5.2.13).

PROGRAMMING

The **5.2.12 SIP Stack/Ext/Trunk Options** Device Manager Menu has been updated. **SIP Trunk Configuration** options have been added to support the **Malicious Call Restriction** feature.

5.2.12.SIP Stack/Ext/Trunk Options		
	Item	Value
SIP Stack Configuration	Invite Ring Time (100ms)	50
	Provisional Time (100ms)	1800
	Invite No Response Time (100ms)	50
	General No Response Time (100ms)	50
	Request Retry Time (100ms)	80
SIP Extension Configuration	Signal Port	5060
	IPUMS/IVR Signal Port	5070
	SIP Expire Time (sec)	600
	NAT Reg Expire Time	60
SIP Trunk Configuration	Default SIP Carrier	1
	iBG Expire Time (sec)	10
	LCR Fast Setup	Disable
	Incoming Mode	Follow DID Translation
	Peer CLI Table	1
	Received CLI Forward On Alias	Disable
	Comm Exclusive	Response
	Common MSG Block Timer (Sec)	600
	Register MSG Block Timer (Sec)	60
	Register Retry Limit	2

FIELD	PURPOSE
Comm Exclusive	<p>Sets how OfficeServ system responds to SIP messages from unauthorized IP address.</p> <p>None: Disable this feature and system will respond to SIP calls from all IP addresses</p> <p>Response: OfficeServ system will respond with the deny message (403 forbidden) when receiving SIP/Peering messages from unauthorized IP addresses</p> <p>No Response: OfficeServ system will ignore all SIP messages from unauthorized IP address and block the relevant IP address. The system will also block the IP address for a specified time period when a SIP phone tries to register to the system several times with an invalid User ID or password</p>
Common MSG Block Timer	Sets how long OfficeServ blocks the SIP messages except from unauthorized IP address. Timer value is from 1 ~ 84600 seconds
Register MSG Block Timer	Sets how long OfficeServ blocks the REGISTER message for unauthorized IP address. Timer value is from 1 ~ 84600 seconds
Register Retry Limit	Sets the number of times (1~5) a user can try to register a SIP phone using an invalid User ID or password. The OfficeServ system blocks the IP address of the SIP phone after the maximum limit is reached.

4.21 SVM E-Mail Gateway with SSL/TLS Security

GENERAL DESCRIPTION

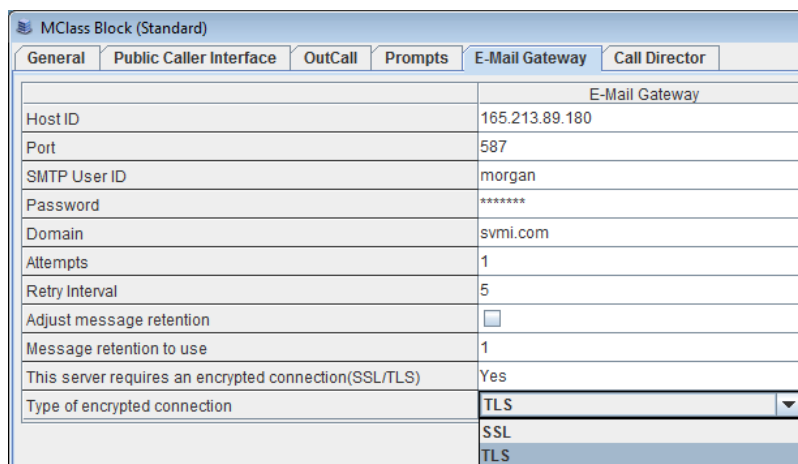

The Samsung voicemail (SVM) has been enhanced to include both SSL and TLS encryption for secured communications between the voicemail email gateway application and the local/remote mail server(s). With the growing amount of threats to business data security, VoIP communications are exposed to data security threats such as hacking and network virus attacks which could be devastating to business communications. To ease or eliminate the risk, both SSL (secure socket layer) and TLS (transport layer security) options have been added to the OfficeServ SVM.

Notes:

1. Requires Version 4.60 software or higher on the OfficeServ 7030, 7100(Mp10a), and 7200-S.
2. SSL and TLS security is not supported on the 7200 and 7400 with the SVMi20E.
3. Multiple email service providers or accounts can be used at the same time based on mailbox user to MClass assignment.

PROGRAMMING

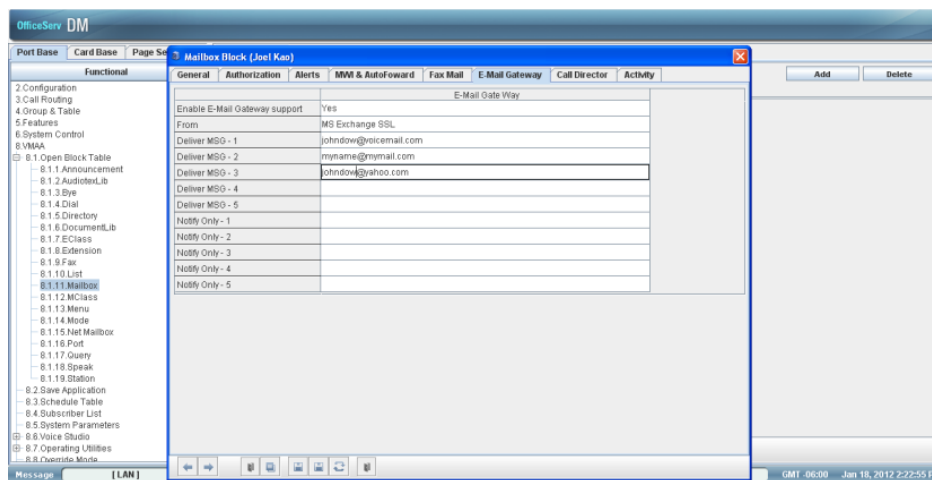

On Device Manager, access the VM/AA function and go to menu **8.1.12**, and build the **MClass block**. Then go to the E-mail Gateway tab and create mail server table with the **Host ID, Port, User ID, Domain, enable encryption**, and set the **encryption type**. See the example below.

E-Mail Gateway	
Host ID	165.213.89.180
Port	587
SMTP User ID	morgan
Password	*****
Domain	svmi.com
Attempts	1
Retry Interval	5
Adjust message retention	<input type="checkbox"/>
Message retention to use	1
This server requires an encrypted connection(SSL/TLS)	Yes
Type of encrypted connection	TLS

FIELD	PURPOSE
This server requires an encrypted connection (SSL/TLS)	Set this option if the mail server requires encrypted connection (SSL/TLS). This option should be set to yes.
Type of encrypted connection	<p>TLS: SVM first send "STARTTLS" command to the mail server before it begins encrypted connection.</p> <p>SSL: SVM starts encrypted connection with the mail server directly.</p> <p>Please contact your E-Mail server administrator which one is supported in your mail server.</p>

Next go to **Mailbox block 8.1.11** and **enable email gateway** and setup the **delivery MSG(s)** for each mailbox user that is using the email gateway application. See the example below.

NOTE: The from field in the mailbox block may require a valid address from the mail server (MS Exchange). For example, from: jdown.samsung.com.

System Parameters settings for email gateway in menu **8.5** is optional. This table can be setup to send out mail to notify the on or off-site system administration of errors in sending out mail. These SMTP server parameters are not use for subscriber email delivery and/or message notification. The parmeters set in SMTP servers section of this page are use for sending mail to the address set in the "report" field. See the example below.

8.5.System Parameters				
General	Management	Language	E-mail Gateway	DNS
SMTP Server				
Host ID	165.213.89.180			
Port	587			
SMTP User ID	morgan			
Password	*****			
Domain	svmi.com			
This server requires an encrypted connection(SSL/TLS)	Yes			
Type of encrypted connection	TLS			
Report	SSL			
Reply To	TLS			
TimeZone	Greenwich Mean Time			
Daylight Saving	Yes			
License Key	NUHQGBWK-1H6GX9Q8-THUFDL90-C			

FIELD	PURPOSE
This server requires an encrypted connection (SSL/TLS)	Set this option if the mail server requires encrypted connection (SSL/TLS). This option should be set to yes.
Type of encrypted connection	<p>Two types of connections are supported:</p> <p>TLS: The client issues a STARTTLS command. If the server accepts this, the client and the server negotiates an encryption mechanism.</p> <p>SSL: Encryption negotiation starts immediately without STARTTLS command.</p>

5. NEW HARDWARE

This chapter introduces the new SVMi-20i, 8COMBO3, 8SLI3, and 16SLI3 cards.

- General Description
 - This section will describe the purpose and market usage of the cards
- Installation
 - For hardware or applications this section will detail the installation of the equipment or program
- Programming
 - This section will detail any relevant Device Manager menu changes relating to the cards

GENERAL DESCRIPTION

Due to difficulty obtaining parts for the existing **Samsung Voicemail** card, the **SVMi-20E**, version 4.60 software also enables the use of a new **Samsung Voicemail** card, the **SVMi-20i**!

The **SVMi-20i** is a radical redesign of the older card and offers many new or enhanced features:

- **Built-In MGI channels for communicating with IP stations and trunks**

When connected to the data network the SVMi-20i offers its own internal MGI channels which allow communications to IP phones, SIP trunks, and other IP devices without using valuable system MGI resources. This ensures that the SVMi-20i offers the clarity, reliability, and power of a digital solution while supporting the flexibility of VoIP.

- **Up to 20 channels without add-on cards**

During design of the new card one of the chief targets was to eliminate the need to expand the port capacity of the **Samsung Voicemail** through daughter-boards or other types of add-on hardware. The **SVMi-20i** card is equipped with **20 voicemail ports** with an out-of-the-box **license** for **4**. Through the purchase of a system **Resource License** up to **16** more ports can be turned on through software licensing without the need to install new hardware. Note: Voicemail licenses can be purchased in 4 port increments.

Best of all, the **Resource License** is keyed against the specific OfficeServ 7000 Series system the card is installed in, so even if the **SVMi-20i** card must be replaced at some future date a new card can be installed **without** the need to purchase a new license or transfer the old one.

NOTE: Due to the added processing load of encrypting voice packets, enabling sRTP encryption for the SVMi-20i's built-in MGI channels reduces the maximum number of voicemail ports from 20 to 16 ports max.

- **Up to 4 Fax Mail channels without add-on cards**

In addition to the built-in 20 voicemail ports the **SVMi-20i** card also offers up to **4 Fax Mail ports** that can be purchased as a part of the **Resource License**. These **Fax Mail ports** allow voicemail users to receive fax messages directly in their voicemail box where they can be later printed to **any** nearby fax machine. Note: Fax licenses can be purchased in single port increments.

NOTE: Each Fax Mail port in use reduces the number of voicemail ports by 1. As an example, if 1 Fax Message is being received on a 20 voicemail-port, 4 fax-port system, only 19 voicemail ports will be available, any 3 of which may be used for fax as needed.

- **TLS/SSL encryption support for Email Gateway**

In recent months the majority of public email servers have begun to use encryption methods to secure emails and email servers. To ensure that the **Email Gateway** unified communications engine in the **SVMi-20i** remains useful the new card allows the **Email Gateway** to use both **TLS** and **SSL encryption** when communicating with customers' mail servers.

- **Device Manager Programming**

To bring the integration of the OfficeServ 7000 Series and the Samsung Voicemail systems more in line, the SVMi-20i card is configured exclusively through the Device Manager system-configuration utility. This eliminates the extra step of using a separate application to program the voicemail, and also allows greater efficiency and familiarity for technicians in the field.

NOTE: The Port Activity status monitoring application cannot be used with the Device Manager, and instead requires a telnet connection. Details on accessing port activity can be found in the Programming section of this article.

- **Automatic .wav file prompt conversion**

With the rapid evolution of audio codecs, specifically in the VoIP market, it is increasingly difficult to locate a recording studio capable of generating the specific audio file formats used by various voicemail systems. The SVMi-20i card gets around this by allowing a technician to upload a standard-format .wav audio file that will be automatically converted to the appropriate audio codec for internal use by the Samsung Voicemail.

NOTE: The wav file must be 8000 Hz mono 16 bit signed 128kbps

- **Increased Message Storage Space**

The SVMi-20i card redesign also eliminated the need for either a hard drive or a flash card by changing the file storage method to an 8 Gb solid-state drive. Not only does this allow greater stability and reliability, but it also offers up to 240 hours of voicemail storage.

- **Automatic Message Purge**

Version 4.60 adds a command that allows **all voicemail and faxmail messages** stored in the **SVMi-20i** card to be **immediately purged** by the technician or system administrator.

INSTALLATION

SVMi-20i Faceplate and LED Indicators

LED / PORT	PURPOSE
LAN Port	This Gigabit Ethernet data port is used to connect the SVMi-20i to the data network.
SIO Port	This port is used to access port activity when LAN connectivity is not possible.
RST Button	This button is used to immediately reboot the SVMi-20i card. NOTE: Use the Reset button only as a last resort, as rebooting in the middle of any disk write cycle can cause data corruption.
PWR LED	When lit green this LED indicates the card has power.
RUN LED	When flashing red this LED indicates that the SVMi-20i's operating system has booted. NOTE: This LED does not indicate that the card is initialized and ready to answer calls, only that it is ready to boot.
IPC LED	This LED flashes to indicate that the SVMi-20i is communicating with the OfficeServ 7000 Series main processor card.
LAN LED	This LED lights up to indicate that the LAN Port is connected. When flickering this LED means that data is being transferred . A red LED indicates a 10 base-T connection. A green LED indicates a 100 base-T connection. An orange LED indicates a Gigabit Ethernet connection.
SVC LED	When flashing green this LED means the card is in service and ready to answer calls. When flashing red this LED means that all ports are in use .
VM LED	When this LED is lit there are voicemail ports currently in use .
MC LED	This LED will flash green when the solid-state drive is being accessed.
MEM LED	This LED indicates the current remaining voicemail message storage space . A green LED means more than 50% of the storage space is free . An orange LED indicates that 20% to 50% of the storage space is free . A red LED means that less than 20% of free space remains.

The **SVMi-20i** card may be installed in **any** slot of the **OfficeServ 7400 main** or **expansion** cabinets. While the card may be installed in **any** slot of an **OfficeServ 7200 main** or **expansion** cabinet it will **only** function at a full **20 ports** if installed in slot **3, 4, or 5** of the **main cabinet**.

PROGRAMMING

Two Device Manager Menus have been edited to support the new functions of the SVMi-20i card: **2.1.5 System Options** and **2.1.6 SVMi Options**. Two new menus have also been created to configure the card: **2.2.17 SVMi-20i Card** and **5.2.26 SVMi-20i Options**.

In addition to these added and changed menus an entire programming section has been added to the Device Manager to support the programming of the SVMi-20i card. Section **8 VMAA** has been added with all of the Samsung Voicemail programming options:

8.1 Open Block Table

8.2 Save Application

8.3 Schedule Table

8.4 Subscriber List

8.5 System Parameters

8.6 Voice Studio

8.7 Operating Utilities

8.8 Override Mode

8.9 View System Report

8.10 Site Information

8.11 Status Screen

For in-depth information on each of these programming options see the corresponding heading in the **SVMi Technical Manual**. Programming screens vary slightly due to the graphical differences between the **Serial port** and **Device Manager** interfaces, but all fields and features work the same. Every effort has been made to ensure that screens are formatted similarly so that users familiar with the other **Samsung Voicemail** platforms have little to no learning curve adapting to the new **SVMi-20i** platform.

NOTE: *The Port Activity monitor is not accessible through the Device Manager for performance reasons. To access Port Activity connect to the SVMi-20i card through telnet port 23. Log in with the username "admin" and the password "samsung" when prompted. At the Linux command prompt type "vmcli" and press enter. The resulting screen works identically to the Port Activity screen detailed in the SVMi Technical Manual.*

2.1.5 System Options

This menu is used to configure various system-wide parameters.

2.1.5. System Options		
Item		Value
sRTP Algorithm		Disable
SVM Option	IP Service	Enable
SLI Name Priority		Translation C1 NAME

FIELD	PURPOSE
SVM Option	When Enabled the SVMi-20i card will use its internal MGI channels . When Disabled the SVMi-20i card will disable its internal channels and use system MGIs instead.

2.1.6 SVMi Options

This menu is used to configure generic Samsung Voicemail options.

2.1.6. SVMi Options		
Item		Value
VoIP Trunk		Yes
SVMi Trunk		Yes
SVM Message Purge		No

FIELD	PURPOSE
SVM Message Purge	Sends a command to the SVMi-20i card to purge all voicemail and faxmail messages.

2.2.17 SVMi-20i Card

This menu is used to configure hardware options for the SVMi-20i card.

2.2.17. SVMi-20i Card	
Cabinet/Slot	C1-S7
IP Address	192.168.9.22
Gateway	192.168.9.1
Subnet Mask	255.255.255.0
IP Type	Private with Public
Local RTP Port(start)	30000
Public IP Address 1	216.62.86.242
Public RTP Port 1	30000
Public IP Address 2	0.0.0.0
Public RTP Port 2	30000
Public IP Address 3	0.0.0.0
Public RTP Port 3	30000
FTP Port	21
Upgrade Port	60024

FIELD	PURPOSE
IP Address / Gateway / Subnet Mask	Set the IP address and network information for the SVMi-20i card
IP Type	Sets whether the card is installed in a NAT environment (Private with Public) or not (Private Only)
Local RTP Port (start)	Sets the first UDP port in the range of ports used by the internal MGI channels
Public IP Address 1 ~ 3	Sets the public IP address(es) of the SVMi-20i card in NAT environments
Public RTP Port 1 ~ 3	Sets the first UDP ports in the ranges of ports the card will receive traffic on from the corresponding Public IP Address
FTP Port	Sets the TCP port the card will listen for FTP traffic on
Upgrade Port	Sets the TCP port the card will listen for upgrade requests on when upgrading through the Device Manager

5.2.26 SVMi-20i Options

This menu is used to configure operational settings for the built-in MGI channels on the SVMi-20i card. The majority of the settings in this menu correspond to the same settings found in 5.2.16 MGI Options. For the purpose of this manual only the new settings are detailed.

5.2.26.SVMi-20i Options		
Card Type	Item	Value
SVMi 20i	Audio Codec	G.711
	Echo Cancellation	Enable
	Silence Suppression	Disable
	Gain to Packet	32
	Gain to TDM	32
	RTCP Sending Period(sec)	5
	TOS	00000000
	Minimum Jitter(ms)	30
	Maximum Jitter(ms)	150
	Dual Filter Echo Canceller	8TRK2 Mode
	NLP Option	0
	EC Tail Length(ms)	64
	Jitter Adaptation Period(sec)	1
	Jitter Adaptation Threshold(ms)	250
	EC Gain	32
	Noise Suppression	On
	AGC	On
	Dominant Talker	On

FIELD	PURPOSE
Gain to Packet	Sets the volume gain when the SVMi-20i is talking to an IP station or trunk
Gain to TDM	Sets the volume gain when the SVMi-20i is talking to a non-IP station or trunk
Dominant Talker	When On this setting tells the SVMi-20i card's internal MGI channels to tailor performance for outbound traffic (where the voicemail is doing most of the talking).
Primary Group	This setting is for engineering use only and should be left at the default value of 5 .

5.2 SLI Card Support (8COMBO3/8SLI3/16SLI3)

GENERAL DESCRIPTION

Three new **Single Line Interface** cards are being released with version 4.60: the **8COMBO3**, the **8SLI3**, and the **16SLI3**. These cards are virtually identical to their predecessor cards, the **8COMBO2**, **8SLI2**, and **16SLI2** cards, but have several new hardware enhancements:

- **Built-In Sine Wave Ring Generator**

In order to eliminate the cost and effort required to obtain and install an external ring generator the new SLI3 cards have a built-in ring generator to generate the sine wave ring tone required by certain types of legacy hardware.

- **Built-In DTMF Receivers**

To assist in **DTMF** resource allocation for legacy devices, such as external voicemail systems, the new **SLI3** cards are equipped with a **DTMF receiver** for each port on the card.

NOTE: *The system will still need to be equipped with DTMF Transmitters in order for the single line device to send DTMF digits.*

- **Built-In Caller ID Transmitters**

To help reduce contention for **Caller ID (CID)** transmitters on single line ports the new **SLI3** cards contain one **CID transmitter** for each port on the card. The CID transmitters are used to send caller ID to single line telephones.

NOTE: *The system will still need to be equipped with CID Receivers in order for the single line device to receive incoming CID information on analog and T1 trunks.*

The new cards install and program exactly as the older **SLI2** cards, with one exception: the **16SLI3** is not capable of providing a **Continuous Message Waiting Indicator (MWI)** status and must use a **Blink** cadence.

6. APPENDIX

6.1 Media Resource Usage Chart

GENERAL DESCRIPTION

Three types of media resources are used in the OfficeServ system to process the audio stream.

1. **Media Gateway Interface (MGI):** Main service of MGI is to convert time-division-multiplex digital stream to IP packets and vice versa. It can be assigned one channel at a time as required.
2. **Media Proxy Service (MPS):** Main service of MPS is to translate the IP address of IP packets from one network to the other. Each usage requires two channels: one for private address and one for public IP address. For each MPS call, it takes two MPS channels. MPS service always uses as a pair. It cannot be used as one MPS channel only. For example, 1 MPS = 1 MPS call = 2 MPS channels.
3. **Real-time Tone Generation Service (RTG):** This is new service introduced in v4.60 software. The usage guide is equivalent to MPS resource. One RTG call uses two channels. It always comes as a pair. For example, 1 RTG = 1 RTG channel = 1 RTG call = 2 MPS channels. Its main services are to support ringback and hold tone in all IP calls and to support DTMF (RFC 2833) detection in Mobex feature.

Usage Chart

Call Conversation State

	IP Trunk (SIP, SPnet, H323)	PSTN Trunk (PRI, Analog)	Local IP Phone	Remote IP Phone	Voice Mail
Local IP phone (ITP, or SMT-I, or SMT-w, or 3 rd party SIP phone)	2 MGI chs or 1 MPS call	1 MGI ch	0	2 MGI chs or 1 MPS call	1 MGI ch
Remote IP phone (ITP, or SMT-I, or SMT-w, or 3 rd party SIP phone)	2 MGI chs or 1 MPS call	1 MGI ch	2 MGI chs or 1 MPS call	2 MGI chs or 1 MPS call	1 MGI ch
Non-IP phone (TDM, or analog, Fax machine, or SVMi)	1 MGI ch	0	1 MGI ch	1 MGI ch	0

Trunk Ringing State

	IP Trunk (SIP, SPnet, H323)	PSTN Trunk (PRI, Analog)
Local IP phone (ITP, or SMT-I, or SMT-w, or 3 rd party SIP phone)	2 MGI chs or 1 RTG call	1 MGI ch
Remote IP phone (ITP, or SMT-I, or SMT-w, or 3 rd party SIP phone)	2 MGI chs or 1 RTG call	1 MGI ch
Non-IP phone (TDM, or analog, Fax machine, or SVMi)	1 MGI ch	0

Hold/Music-On-Hold State

	IP Trunk (SIP, SPnet, H323)	PSTN Trunk (PRI, Analog)
Local IP phone (ITP, or SMT-I, or SMT-w, or 3 rd party SIP phone)	1 MGI ch or 1 RTG call	0
Remote IP phone (ITP, or SMT-I, or SMT-w, or 3 rd party SIP phone)	1 MGI ch or 1 RTG call	0
Non-IP phone (TDM, or analog, Fax machine, or SVMi)	1 MGI ch	0

Paging State

	Receiving Local IP Phones supporting multicast paging (SMT-I, or SMT-w5120)	Receiving Local IP Phone NOT supporting multicast paging (ITP, or 3 rd party SIP)	Receiving Remote IP Phone supporting multicast paging (SMT-I, or SMT-w5120) AND router supporting multicast	Receiving Remote IP Phone supporting multicast paging (SMT-I, or SMT-w5120) but router NOT supporting multicast	Receiving Trmote IP Phone NOT supporting multicast paging (ITP, or 3 rd party SIP)
Originator Local/Remote IP Phone (ITP, or SMT-I, or SMT-w, or 3 rd party SIP)	2 MGI chs (1 for originator and 1 for all receiving IP phone)	2+ MGI ch (1 for originator and 1 for each receiving IP phone)	2 MGI chs (1 for originator and 1 for all receiving IP phone)	2+ MGI ch (1 for originator and 1 for each receiving IP phone)	2+ MGI ch (1 for originator and 1 for each receiving IP phone)
Non-IP phone (TDM, or analog, Fax machine, or SVMi)	1 MGI ch (0 for originator and 1 for all receiving IP phones)	1+ MGI ch (0 for originator and 1 for each receiving IP phone)	1 MGI ch (0 for originator and 1 for all receiving IP phones)	1+ MGI ch (0 for originator and 1 for each receiving IP phone)	1+ (0 for originator and 1 for each receiving IP phone)

6.2 System Port Usage

Module	Service	Protocol	Port
MP	SIP	UDP/TCP TCP	5060 5061
	H.323	TCP UDP	1720 1719
	SPNET	TCP	6100
	ITP	UDP	6000, 9000
	WIP	UDP	8000, 8001
	MVS	TCP	9012
	DM	TCP	5090,5091
	DM FTP	TCP	21
	DM Data	TCP	5090
	DM File Control	TCP	5003
	DM Embedded VM	TCP	6001, 6002
	ITT	TCP	5090, 5091
MGI16 MGI64 OAS	MGI	UDP	30000~ (2*Num of Ch -1)
	MPS	UDP	40000~ (2*Num of Ch -1)
	RTG	UDP	45000 ~ (2*Num of Ch-1)
CNF24	Conference	UDP	30000 ~ (2*Num of Ch -1)
	FTP	TCP	21
	Upgrade Port	TCP	60000
SVMi-20i	VM Control	TCP	6001,6002
	VM	UDP	30000 ~ (2*Num of Ch -1)
	FTP	TCP	21
	Upgrade port	TCP	60024

6.3 Software Package

Data Base File

The data base file from previous software version is **not compatible** with v4.60 software. You will need to use new DM software from v4.60 to download the old data base file to a PC. After upgrading OfficeServ system to v4.60, upload the data base file which was save on the PC to the OfficeServ system.

V4.60 Software Compatibility Chart

	Card Software Version	MP V4.53c	New Release: MP V4.60 7030/7100/7200s: v4.60 (20120216) 7200/7400: v4.60 (20120206)
SVMi20I	V6.00i or higher	No	Yes
(SVMi-20E)	V5.4.1.1 or lower	Yes	Yes
LP40 (SP40)	V1.27 or lower	Yes	Yes: (No new features)
	V2.00, 20111209 (New version)	Yes: (No New features)	Yes
LCP	V4.20 or lower	Yes	Yes: (No new features)
	V4.30, 20111209 (New version)	Yes: (No new features)	Yes
MGI-16/64	V1.27 or lower	Yes: (No new features)	Limitation^(*)
	V1.28, 20111209 (New version)	Limitation^(*)	Yes
(Discontinued MGI cards)	V1.16 or lower	Yes	Yes: (No new features)
OAS	V2.02 or lower	Yes	Limitation^(**)
	V2.03, 20111209 (New version)	Limitation^(*)	Yes
CNF24	V1.01 or lower	Yes	Yes: (No new features)
	V1.02, 20111125 (New version)	Yes: (No new features)	Yes
SMT-I Phones	Lower version	Yes	Yes: (No new features)
	SMT-i3105: v1.56 ('12.01.20) SMT-i5210: v1.36 ('12.01.20) SMT-i5220: v2.31 ('12.01.26) SMT-i5230: v1.26 ('12.02.04) SMT-i5243: v1.85 ('12.01.20) SMT-i5264: v1.25 ('11.11.16)	Yes: (No new features)	Yes
SMT-w5120	Lower version	Yes	Yes: (No new features)
	V2.03.05 ('11.05.31)	Yes: (No new features)	Yes

Limitation^(*) Sending & Receiving DTMF on SIP Trunk and SPNET (Both in-band and out-band are not supported. So The feature using DTMF like Mobex is not supported.

Limitation^()** If MPS is used on old OAS software, new feature is supported.
If MGI is used on old OAS software, new feature is not supported.

The data base conversion principal stays the same. You will need to use the latest DM to download the old data base file. Then upload the old data base file to the system after the system is upgraded to new software.

There are some changes on the software upgrade procedure.

1) IT Tool

IT tool is no longer supported from v4.60. IT tool is replaced by embedded DM (Device Manager) and standalone DM.

2) DM (Device Manager)

Device Manager will work with system software version 4.53b or higher. For more information, please refer to section 6.5 of this document or download Product Bulletins 229_Software_v4.53b_Release and 230_Device_Manager from GSBN, under Communication, Technical Support, Downloads, Product Bulletin.

- a) DM has new security measure. ID and password of a IP phone cannot be set to the same. DM will not let you save the password if it is the same as ID. However, DM will let you upload the previous database that contains the same IP and password.
- b) You can use either standalone DM or embedded DM to access the OfficeServ system. If you use standalone DM, make sure you are use the latest version. It is recommended to use embedded DM because it always synchronizes with the system software. Embedded DM (device manager) is available to all OfficeServ 7000 system now. Access to the embedded DM is as simple as type in the OfficeServ IP address from the Internet Explorer. It doesn't matter the access in from the private or public network. For example, if the OfficeServ IP address is 222.33.44.555. You can access the embedded DM by type in either

- [http:// 222.33.44.555](http://222.33.44.555)
- [https:// 222.33.44.555](https://222.33.44.555)

Note: Please always use the latest Java script on your PC.

- c) DM can access embedded VM, ie. OS 7030, OS 7100, and OS 7200s now.

Device Manager with version 4.60 software is designed to support local and remote programming of the OfficeServ systems via LAN/WAN (IP) or serial (modem) connection. LAN/WAN connectivity should be the preferred option because of the speed and availability of the internet. In some cases where internet connectivity is not available, a serial modem connectivity can be used as an alternative to LAN connection, but with

limitations. The Device Manager via modem is much slower and is limited in functionality.

Notes:

- *Device Manager (via modem) connectivity **cannot** be used to support **voicemail configuration or software package upgrading**.*
- *The OS7030, 7100, 7200s with IT Tool/Web Management did support voicemail configuration or software package upgrading via modem but **IT Tool/Web Management is not available** on OfficeServ **4.60 or higher** products.*
- *Understand the limitations with Device Manager (via modem) before electing to use it as an option to the IT tool, Web Management or Device Manager via LAN/WAN connectivity.*

DM has several advantages over IT.

- a) Embedded DM is integrated with MP. If you use the embedded DM, you are sure you always use the same software version as MP.
- b) DM is based on the Java technology. It means OS independent. DM can be used in Linux and Mac OS. However, DM saves system data base in the PC format. Don't run DM in other operating system to perform database conversion.

3) MP20/MP40

The v4.60 software packages cannot be upgraded through DM because the main software file size is over the 20M bytes limitation. You will need to copy v4.60 software to the SD card.

4) OS 7030/MP10a/MP20s

For these systems, you can either use DM or SD card to upgrade the system software. However, the numbers of software files have been increased from 7 to 9.

- <Previous>
ap1av460.pkg, cs1av440.pkg, dr1av460.pkg, ms1av460.pkg, rd1av460.pkg, rt1av460.pkg, ws1av460.pkg
- <Current>
ap1av460.pkg, cs1av440.pkg, dr1av460.pkg, ms1av460.pkg, rd1av460.pkg, rt1av460.pkg, ws1av460.pkg, **osdm.jar, osdmhelp.jar**

When upgrading system software to v4.60, the embedded voice mail (VM) data base is remained un-touched. That means, **you don't need to convert the embedded VM data base file**. You just need to convert the system data base file.

If you want to save embedded VM data base file, you need to use the following procedure.

- a) System software is between v4.1x to v4.5x
 - (1) You have to use **Web management** to download VM data base file. Same procedure as before.
 - (2) **You cannot use latest DM to save VM data base file when system has old software.**
- b) System software is v4.60
 - (1) You have to use latest **DM** to download the VM data base file.
 - (2) You can upload the VM data base file (which is either saved by the previous Web management or save by latest DM) to the system.

5) LP 40

- MP40 should be upgraded to V4.60 before upgrading LP40 because only new MP40 software version can recognize new LP40 file name.
- The designation of LP40 package is changed from LP4xxxxx.PGM to SP4xxxxx.PGM.
- The new LP40 package, SP40V200.PGM contains both LP40 bootrom and LP40 software file. When you try to upgrade LP40 package to V2.00 from an earlier version than V2.00 in MMC818, it will take about 13 minutes because OS7400 system tries to upgrade bootrom for the first 7 minutes and then LP40 package for about 6 minutes.

6.4 Software Upgrade Procedures

1. The OS7400 Upgrade Procedures

Any upgrade to V4.60 will default the database, so doing a backup with DM (Device Manager) is a must. Also the new files must be manually copied to the SD card using a PC.

- 1) Backup the database by using the latest DM.
- 2) Delete all files off the SD card.
- 3) Unzip the zipped file on the PC and copy all unzipped contents to the SD card.
- 4) Insert the SD card back into the switch and power cycle the switch.
- 5) Copy the previous database file back onto the switch.
- 6) Access MMC 818 with a phone and upgrade the LP40 or multiple LP40 cards has needed. Each card will take around 15 minutes to upgrade. Do not stop this process.
- 7) Upgrade any MGI-16, MGI-64 or OAS cards to the latest software version using the MGI-16 procedure.
- 8) Upgrade all CNF-24 cards using the upgrade procedure.
- 9) Do a backup onto a PC using DM program and complete a backup using KMMC to the SD card using MMC 815.
- 10) Upgrade all SMT-I phones.
- 11) Upgrade complete.

2. The OS7200 MP20 Upgrade Procedure

Any upgrade to V4.60 will default the database, so do a backup with Device Manager is a must.

- 1) Backup the Database to the PC.
- 2) Take the SD card out of the switch and put in PC. Delete all files off the SD card.
- 3) Unzip the zipped file on the PC and copy all unzipped contents to the SD card.
- 4) Insert the SD Card back into the switch and power cycle the switch.
- 5) Re-login into the switch after it boots into service and copy the database back to the switch. This restores the database to the switch.
- 6) Access MMC 818 and upgrade the LCP Card if this is a two cabinet OS7200 system.
- 7) Upgrade any MGI-16 and OAS card to be able to use any new features and hardware.
- 8) Upgrade all CNF-24 cards using the upgrade procedure.
- 9) Do a backup onto a PC using DM program and complete a backup using KMMC 815 to the SD card.
- 10) Upgrade all SMT-I phones.

- 11) Upgrade Completed.

3. The OS7200S MP20S Upgrade Procedure

Any upgrade to V4.60 will default the database, so doing a backup with Device Manager is a must. Start with downloading the latest DM program and using it to download the database.

- 1) Download the database to the PC using the latest DM program.
- 2) Download the MP20S program off the FTP site and UNZIP the files onto a folder.
- 3) Login with DM and access the FILE CONTROL section.
- 4) Select the folder with the unzipped version of 4.60 software and upload the files to the SD card. Overwrite any files showing duplicated. Make sure the INI is updated selecting the new files uploaded.
- 5) Reboot the switch and verify that the software shows V4.60 in MMC 727.
- 6) Login with DM and upload the database that was just downloaded.
- 7) Verify that the switch is stable and calls can be made.
- 8) Download a new database for a backup.
- 9) Upgrade any OAS or MGI-16 cards installed with the latest software.
- 10) Upgrade all SMT-I phones.
- 11) Upgrade Completed.

4. The OS7100 MP10A Upgrade Procedure

Any upgrade to V4.60 will default the database, so doing a backup with Device Manager is a must. Start with downloading the latest DM program and using it to download the database.

- 1) Download the database to the PC using the latest DM program.
- 2) Login with DM and access the FILE CONTROL section.
- 3) Select the folder with the unzipped version of 4.60 software and upload the files to the SD card. Overwrite any files showing duplicated. Make sure the INI is updated selecting the new files uploaded.
- 4) Reboot the switch and verify that the software shows V4.60 in MMC 727.
- 5) Login with DM and upload the database that was just downloaded.
- 6) Verify that the switch is stable and calls can be made.
- 7) Download a new database for a backup.
- 8) Upgrade any OAS or MGI-16 cards installed with the latest software.
- 9) Upgrade all SMT-I phones.
- 10) Upgrade Completed.

5. The OS7030 Upgrade Procedure

Any upgrade to V4.60 will default the database, so doing a backup with Device Manager is a must. Start with downloading the latest DM program and using it to download the database.

- 1) Download the database to the PC using the latest DM program.
- 2) Login with DM and access the FILE CONTROL section.
- 3) Select the folder with the unzipped version of 4.60 software and upload the files to the system. Overwrite any files showing duplicated. Make sure the INI is updated selecting the new files uploaded.
- 4) Reboot the switch which will take 15 minutes and verify the software shows V4.60 in MMC 727.
- 5) Login with DM and upload the database that was just downloaded.
- 6) Verify that the switch is stable and calls can be made.
- 7) Download a new database for a backup.
- 8) Upgrade all SMT-I phones.
- 9) Upgrade Completed.

6. MGI-16 and MGI-64 Upgrade Procedure

- 1) Unzip the files in the C drive in a folder called (MGI16) OR (MGI64)
- 2) Access a TFTP Program example (SOLAR WINDS) and select file and configure the access to the (C:\) drive only.
- 3) Access the START, RUN, CMD to access a telnet session from PC.
- 4) Type (TELNET XXX.XXX.XXX.XXX) to access the MGI card for programming. XX is the IP address of the MGI.
- 5) The IP address will be the one in MMC 831 for that card.
- 6) Login onto the card with user name of mgi and password of mgi12345.
- 7) Type in (ALLSET)
- 8) The system will respond with current IP Address which should be the MGI card IP address.
 - a. Change this address if it needed.
- 9) The next prompt will be the SUBNET MASK which is 255.255.255.000
- 10) The next prompt will be the GATWAY. Put in your gateway.
- 11) The next prompt will be the I/O Server which is the **PC IP address**.
- 12) When the system responds, 20 seconds later, type in (REBOOT) to reboot the card.
- 13) The telnet session will disconnect after 20 seconds and 10 seconds later, the
 - a. TFTP solar winds window will show the files loading. The card will reboot after the
 - b. Upload.
- 14) After a few minutes, access DM 2.2.0 (MMC 727) and verify the software load and date is correct.
- 15) Upgrade Complete.

7. OAS Upgrade Procedure

- 1) Unzip the files in the C drive in a folder called (OAS1).
- 2) Access a TFTP Program example (SOLAR WINDS) and select file and configure the access to the (C:\) drive only.
- 3) Access the START, RUN, CMD to access a telnet session from PC.
- 4) Type (TELNET XXX.XXX.XXX.XXX) to access the OAS card for programming. XX is the IP address of OAS card.
- 5) The IP address will be the one in DM 2.2.2 (MMC 831) for that card.
- 6) Login onto the card with user name of mgi and password of mgi12345.
- 7) Type in (ALLSET)
- 8) The system will respond with current IP Address which is the MGI card IP address. Change this address if it needed.
- 9) The next prompt will be the SUBNET MASK which is 255.255.255.000
- 10) The next prompt will be the GATWAY which is 105.52.21.1. Put in your gateway.
- 11) The next prompt will be the I/O Server which is the PC IP address.
- 12) When the system responds, 20 seconds later, type in (REBOOT) to reboot the card.
- 13) The telnet session will disconnect after 20 seconds and 10 seconds later, the TFTP solar winds window will show the files loading. The card will reboot after the upload.
- 14) After a few minutes, access MMC 727 and verify the software load and date is correct.
- 15) Upgrade Complete.

8. CNF-24 Upgrade Procedure

- 1) Unzip the voice prompts onto a folder on your PC. The main CNF-24 program should not need to be unzipped for this upgrade.
- 2) Login onto the switch using the latest DM program.
- 3) Access the UTIL section from the main screen.
- 4) Access the PACKAGE UPDATE from this UTIL section.
- 5) You will see CNF-24 card on the switch
- 6) Select the CNF-24 card and select the (...) to browse to the upgrade file.
- 7) Select upload and restart after selecting the file.
- 8) You will see the progress of the upgrade. 2 minutes max to complete.
- 9) The CNF-24 card will restart after the upgrade.
- 10) Login into the switch and access MMC 727 and verify the correct version.
- 11) Upgrade Completed.

9. **CNF-24 PROMPT Upgrade**

- 1) Download the PROMPT file and unzip it onto a folder on your pc.
- 2) Access a FTP program and Upload prompts to /mnt/nand0/prompt/ by using FTP. (ID: admin, PW: Samsung)
- 3) Copy all the prompts onto this location in the previous step. You can override the prompts that show a duplicate.

10. **SMT-I Phone Upgrade Procedure**

Pull software from phone

- 1) Run TFTP or HTTP server on the PC. PC must be in the same network as the OfficeServ.
- 2) Set the root directory of TFTP or HTTP to the main unzipped phone software folder. Main folder must contain a subfolder called "ITP-SERIES".
- 3) Access phone software upgrade menu from the engineering mode. Two ways to enter to the engineering mode.
 - a. Press and hold * key while powering up the phone, or
 - b. Press *153# while phone displays the phone information.
 - i. To display phone information, Menu -> Phone -> Phone Information
- 4) Set PC IP address to the "Upgrade Server" menu and start software upgrade

Push software to phones

	Start Time (Hour)	Phone Connect
	Start Time (Min)	Auto Time

1) Run TFTP or HTTP server on the PC. PC must be in the same network as the OfficeServ.

2) Set the root directory of TFTP or HTTP to the main unzipped phone software folder. Main folder must contain a subfolder called "ITP-SERIES".

3) In DM 5.2.10, set software version number, upgrade Server IP address (PC), and type (MMC command). Upon saving the DM setting, system will push the software to phone.

6.5 Product Bulletins: 229 and 230

Product Bulletin 229_Software_v4.53b-Release: Software Version 4.53b Availability.

Product Bulletin 230_Device Manager: Device Manager for OfficeServ 7000 System Embedded and Client Versions Now Available.

Bulletin No.: 229_Software_v4.53b_Release

February 7, 2011

Software Version 4.53b Availability

Samsung Telecommunications America is pleased to announce the release of the V4.53b main system software for the **OfficeServ™ 7400 MP40**, **OfficeServ™ 7200 MP20**, **OfficeServ™ 7200-S MP20S**, **OfficeServ™ 7100 MP10a**, and **OfficeServ™ 7030** Systems.

AVAILABILITY

Effective February 7, 2011, all orders for the OfficeServ 7400 MP40, OfficeServ 7200 MP20, OfficeServ 7200-S MP20S, OfficeServ 7100 MP10a, and OfficeServ 7030 will ship with software version 4.53b. The OfficeServ 7200 MCP and OfficeServ 7400 Smart Media processors do not support software version 4.51 or V4.53b software.

All versions of V4.53b MP software are available for download from the Global Samsung Business Network (GSBN) website, www.samsunggsbn.com under Communication → Technical Support → Downloads → Released Software.

NEW FEATURES

1. Conference Card

Version 4.53b for the OfficeServ 7200 MP20, OfficeServ 7400 MP40, and OfficeServ 7200S MP20S supports the new CNF24 card that provides the Meet-Me Conference application. [See Product Bulletin 228 CNF 24 Release for details.](#)

- New MMC 870/DM 9.1.1: Technician level set up for the CNF24 card.
- New MMC 871/DM 9.1.2: IP addressing for CNF24 card.

Samsung Telecommunications America
Business Communication Systems
1301 East Lookout Drive
Richardson, TX 75082

Samsung Software Version 4.53b Availability

NEW FEATURES-CONTINUATION

2. Device Manager (Embedded and Client Version)

Device Manager is a replacement for Installation Tool, it is embedded in version 4.53b on the MP40, MP20 and MP20S, and it is use to manage these three OfficeServ systems. Version 4.53b supports Device Manager Client version on all OfficeServ 7000 systems. [See Product Bulletin 230 Device Manager Availability for details.](#)

3. Hold Mode with SIP Trunks

SIP Providers have the right to override the OfficeServ Media request when playing MOH. This causes confusion. Who is controlling MOH? A new setting has been added to give more options to deal with various SIP providers. OfficeServ has a new setting “**Hold Mode**” added to MMC 837 or IT/DM 5.2.13. It has the following characteristics:

- SENDONLY: Request to SIP Provider to play OfficeServ MOH (Provider can reply with inactive message and play their MOH to the distant party to save bandwidth).
- INACTIVE: Request to SIP Provider to play SIP Provider MOH.
- SENDRCV: Play MOH from OfficeServ. Provider sees this as two way conversation so they pass the MOH.

This setting only applies when HOLD REINVITE is enabled in MMC 837 or IT/DM 5.2.13 when using MGI channels. When MPS is used HOLD REINVITE is always sent.

BUG FIXES

OFFICESERV 7030 SPECIFIC

1. Ring Plan Lamp Operation

With V4.46d software, changing the ring plan with the RP keys would change the switch ring plan but the lamp operation would revert back to ring plan 1 thirty seconds after a change. The lamp operation was fixed in V4.53b software and will stay with the current ring plan. *This has been fixed in V4.53b software for the OS7030 System.*

OFFICESERV 7100 MP10a SPECIFIC

1. Virtual SLT Port Interaction

When an analog phone is connected to an 8-combo card and a call rings a virtual extension that is on a virtual cabinet but in the same slot and port as that of a physical cabinet, in V4.46d software the physical phone would ring when the virtual port received a call. Example: the analog phone is located at **C1-S2-P2** and the virtual extension is located at **C2-S2-P2**. *This has been fixed in V4.53b software for the OS7100 MP10a System.*

Samsung Software Version 4.53b Availability

2. IP-AOM Addition

We have added IP-AOM (SMT-i5264) to the MMC 841 settings for software upgrades. Prior to V4.53b software, this entry was not available for upgrades being pushed to the devices. This is helpful when upgrading software on this device. *This affects OS7100 MP10a System.*

3. Speech Comes Over Speaker in Headset Mode

Under certain configurations and call scenarios, you could hear speech coming over the speaker when in headset mode. We have modified the software in V4.53b not to open a speech path when following the SECURE OHVA option. This option in MMC 110 is called SECURE OHVA and if ON Off-Hook Voice Announce will be received thru the handset and if OFF will receive thru the speakerphone. *This solution has been added to the OS7100 MP10a System.*

4. WIP 5000 Handset Answering Calls

With Software Version 4.46d, incoming calls could not be answered from the WIP 5000 sets. Pressing the Answer button had no effect – the call would continue to ring. *This has been fixed in V4.53b software for the OS7100 MP10a System.*

5. UCD Supervisor SP Key Dial Tone Issue

With V4.46d software, when users who have SP key assignments on their phone receive a page, the next time they access the SP key they hear dial tone. They have to release and press the SP key assignment again. *This has been fixed in V4.53b software on the OS7100 MP10a System.*

6. Ring Plan Lamp Operation

With V4.46d software, changing the ring plan with the RP keys would change the switch ring plan but the lamp operation would revert back to ring plan 1 thirty seconds after a change. The lamp operation was fixed in V4.53b software and will stay with the current ring plan. *This affected only the OS7100 MP10a System.*

7. 16TRK/8TRK2 Diagnostic Tests

We had an issue when running trunk diagnostics on the 16TRK and 8TRK2 cards. With V4.46d software, running a diagnostic on these cards would lock up the trunks. This required a system reset to clear the locked trunks. This has been corrected with V4.53b software. *This affected the OS7100 MP10a.* This was setup in MMC 854 and codec tests were run on the cards.

8. Call Forward Enhancement Feature

With V4.46d software, forwarded calls will not follow the Trunk/Station Use Table in MMC 314 and MMC 614. If you set up the Station Trunk Use Tables to exclude specific trunks and then make calls, the excluded trunks will not be used. However, if you forward a station to the same outside number, the excluded trunks will be used. After installing V4.53b software, turn on ENHANCED FWD (a new feature in MMC 210) and make the same calls. The calls will follow the setting in the trunk/station use tables. *This affects the OS7100 MP10a System.*

Samsung Software Version 4.53b Availability

9. Switch Language Setting of System Not Saved

On the OS7100 MP10a Switch, changing the switch language from English to French/Canadian would revert back to English after a switch reboot. *This has been fixed in V4.53b software on the OS7100 Switch.*

OFFICESERV 7200-S SPECIFIC: None

OFFICESERV 7200 SPECIFIC: None

OFFICESERV 7400 SPECIFIC: None

ALL OFFICESERV 7000 SERIES

1. Group Display Setting MMC 119

With Software V4.51 and older, the MMC 119 setting Group Name, DDI Name, and DDI number would display for two seconds and then revert back to name and number on the keyset display. With V4.53b software the display will stay on the screen until the user answers the call. *This has been fixed on all OS7000 switch software.*

2. Station Pair and Call Coverage Interaction

Using a combination of Station Pair and Call Coverage to the paired station would not allow the paired station to ring after the Call Coverage delay timer expired. Now the paired station will ring correctly on all OS7000 Switch Products with V4.53b software. *This has been fixed on all OS7000 switch software.*

3. NND Feature and Call Record Looses Call

With Call Record active recording a call, the user access NND feature for the last name and number on their set would disconnect the call. Now with V4.53b software, the call is not disconnected. This affected all OS7000 Switch Products. *This has been fixed on all OS7000 switch software.*

4. Follow Me Forward Feature Interaction

The Follow Me Forward feature when activated will follow the user to their new temporary location but would not forward to the users voice mail after the call forward no answer timer expired. With V4.53b software all OS7000 product lines will follow the called users forward no answer location. *This has been fixed on all OS7000 switch software.*

5. Handset to Speaker Operation

Beginning with V4.46d users had to put a call on hold before switching from Handset to Speaker or from Speaker to Handset. This has been corrected. Users no longer need to press Hold before switching. *This has been fixed on all OS 7000 switch software.*

Samsung Software Version 4.53b Availability

SOFTWARE COMPATIBILITY

When running main software version V4.53b make sure that all other cards and/or applications are upgraded to match the following system software tables:

OfficeServ 7400

MP40	LP40	LCP	MGI16	MGI64	TEPRI	TEPRIa	TEPRI2	OAS
V4.53b 11.01.25	V1.26 10.08.18 V1.27 10.08.26†	V4.18 10.07.12 V4.19 10.08.3 †	V1.26 09.08.26	V1.26 09.08.26	V1.07 07.11.12	V4.28 10.09.07	V4.28 10.09.07	V2.01 09.08.26

† The LCP software must be V4.19 to support CNF-24 if installed in the expansion cabinet.
The LP40 software must be V1.27 to support CNF-24 if installed on the OS7400 system. LP40 V1.26 will operate correctly if no CNF-24 card is installed.

INSTALLATION TOOL

A new version of Installation Tool, version V1.53a dated 11.01.21 is available to support the new system software.

The Installation Tool Software is available for download from the Samsung GSBN (www.samsunggsbn.com) website under Communication → Technical Support → Downloads → Released Software.

SOFTWARE UPGRADES

To upgrade existing systems to this new software you must download the V4.53b system software and the latest Installation Tool software, version V1.53a (11.01.21), from GSBN (located under Communication → Technical Support → Downloads → Released Software) before you attempting any steps below.

Getting Your OfficeServ 7000 System Compatible with Installation Tool

If your OfficeServ 7000 system is not running V4.14k or higher software, you must perform the following steps before attempting to upgrade to V4.53b in order to allow the Installation Tool to connect to the system. As announced in the V4.14k Release Bulletin the OfficeServ Installation Tool is the programming application of choice as it is faster, more feature rich, and easier to use than either WebMMC or the OfficeServ Manager (OSM). With V4.53b the WebMMC and OSM applications can no longer be used to connect to the OfficeServ 7200 or 7400 systems, so if you have not previously upgraded to V4.14k you will need to perform a 2-step upgrade by upgrading to V4.14k first, and then to V4.53b. The following steps will allow you to upgrade to V4.14k:

- A. **OS7400 MP40 and OS7200 MP20 V4.53b** packages cannot be directly upgraded from any earlier version (V4.1x, V4.2x, V4.3x and V4.4x) using **Installation Tool**. It is only possible through V4.51 because of the size of main software package, that is, you have to upgrade twice (V4.1x~V4.4x -> V4.51 -> V4.53b) when you upgrade it by Installation Tool. V4.51 software is available for download from GSBN (Communication, Technical Support, Download, Released Software).

Samsung Software Version 4.53b Availability

However, you can directly upgrade the main software to V4.53b when you upgrade the software by copying the main software package to SD card using PC.

The OS7030, 7100 MP10a and OS7200 MP20 can be upgraded from any previous version.

- B. OfficeServ 7200-S:** No additional steps are required as these systems have always been compatible with the Installation Tool from creation.
- C. OfficeServ 7200:** In order to connect to the OS7200 with the Installation Tool it must be running V4.14k or higher. This means that you must upgrade the system to V4.14k before upgrading to V4.53b. In order to do this you will need to obtain both the V4.14k system software and the OfficeServ Manager (OSM) application version V4.14z (08.07.24) from the GSBN (located under Communication → Technical Support → Downloads → Released Software).

After obtaining these items:

1. Install the new OSM application.
2. Connect the OSM to the system.
3. Using the OSM, download the system database to your PC.
4. Disconnect the OSM from the system
5. Using KMMC programming complete a backup of the system database with MMC 815. This is the emergency backup should anything go wrong.
6. Connect the OSM to the system and use the FILE UPLOAD command to upload the V4.14k system files to the system media card. The required files are:
 - a. MPPSV414K.ZPG
 - b. STARTUP.PRE
7. After the files have been uploaded, reboot the system.
8. The system will reboot to a default condition. Access KMMC 727 to verify that you are now running V4.14K Software.
9. Connect the OSM to the system.
10. Using the OSM, upload the system database from step 3.
11. When upload completes make a few test calls and verify that your database has been restored.
12. Proceed to the next section to upgrade the system from V4.14k to V4.51.
13. After upgrading to V4.51, use the same steps to upgrade to V4.53b software using IT-TOOL.

Samsung Software Version 4.53b Availability

- D. OfficeServ 7400:** In order to connect to the OS7400 with the Installation Tool it must be running V4.14k or higher. This means that you must upgrade the system to V4.14k before upgrading to V4.53b. In order to do this you will need to obtain both the V4.14k system software and the WebMMC application version V1.17.0 (08.03.10) from the GSBN (located under Communication → Technical Support → Downloads → Released Software).

After obtaining these items:

1. Install the new WebMMC application.
2. Connect the WebMMC to the system.
3. Using the WebMMC, download the system database to your PC. This process can take up to 30 minutes.
4. Disconnect the WebMMC from the system
5. Using KMMC programming complete a backup of the system database with MMC 815. This is the emergency backup should anything go wrong.
6. Access KMMC 830 and make note of the SYSTEM IP ADDRESS, as you will need it later.
7. Remove the system media card.
8. Using a media card reader load the V4.14k system file (MPE414.PGM) to the media card.
9. After the file has been uploaded, reinsert the media card in the system and reboot the system.
10. The system will reboot to a default condition. Access KMMC 727 to verify that you are now running V4.14K Software.
11. Access KMMC 830 and set the IP address of the system to the address taken down in step 6.
12. Connect the WebMMC to the system.
13. Using the WebMMC, upload the system database from step 3. You will be asked if you wish to convert the database; choose "Yes".
14. When upload completes make a few test calls and verify that your database has been restored.
15. Proceed to the next section to upgrade the system from V4.14k to V4.51.
16. After upgrading to V4.51, backup the database to the PC and then upload V4.53b software to the SD card using IT-T00L. Restore the database after rebooting with V4.53b software.

Samsung Software Version 4.53b Availability

Upgrading Your OfficeServ 7000 System to V4.53b

After ensuring that your OS7000 system is able to communicate with the Installation Tool you may proceed with the following steps to upgrade the system to V4.53b:

A. OfficeServ 7200-S:

1. Install the new Installation Tool software V1.53a.
2. Connect the Installation Tool to the system and perform a full telephone system database download to save the database to your PC. Consult the Installation Tool User Manual if you are unsure how to connect to a system.
3. When the download completes, disconnect the Installation Tool.
4. Access the Voicemail web interface Operating Utilities menu and perform a voicemail database backup. **NOTE: this backup will not save voicemail messages. Consult the Programming Manual if you are unsure how to perform a voicemail backup.**
5. Using a keyset, log into KMMC programming and complete a backup of the telephone system database with MMC 815. This is the emergency backup should anything go wrong.
6. Reconnect Installation Tool. Then using the Installation Tool File Control feature upload the V4.53b system software files for your specific processor to the media card.
 - a. MP20S File:
 - i. AP2S453b.PKG
 - ii. CS2SV445.PKG
 - iii. DR2S453b.PKG
 - iv. MS2SV718.PKG
 - v. RD2S453b.PKG
 - vi. RT2S453b.PKG
 - vii. WS2S453b.PKG
7. After the files have been uploaded you must delete the old operating system files. The files can be deleted through the Installation Tool's File Control window by checking the box in the **Sel** column relating to the file in question. The files to delete are (where xxxx is anything other than the file names listed above):
 - a. MP20S Files:
 - i. AP2Sxxxx.PKG
 - ii. CS2S xxxx.PKG
 - iii. DR2S xxxx.PKG
 - iv. MS2S xxxx.PKG
 - v. RD2S xxxx.PKG
 - vi. RT2S xxxx.PKG
 - vii. WS2S xxxx.PKG
8. Reboot the system. This can be done by a) pressing the Restart button in the Installation Tool File Control window, b) pressing the Reset button on the MP card, or c) powering down and then back up.
9. The system will reboot to a default condition. Using a keyset access KMMC 727 to verify that you are now running V4.53b Software.

Samsung Software Version 4.53b Availability

10. Log out of KMMC and connect the Installation Tool to the system.
11. Using the Installation Tool, upload the telephone system database from step 2.
12. When upload completes make a few test calls and verify that your database has been restored.
13. Log in to the Voicemail web interface to ensure that voicemail data hasn't been lost. If any loss has occurred, restore the database backup made in step 4.

B. OfficeServ 7200:

1. Install the new Installation Tool software.
2. Connect the Installation Tool to the system and perform a full system download to save the database to your PC. Consult the Installation Tool User Manual if you are unsure how to connect to a system.
3. When the download completes, disconnect the Installation Tool.
4. Using KMMC programming complete a backup of the system database with MMC 815. This is the emergency backup should anything go wrong.
5. Upgrading software depends on the current operating version. If earlier than V4.51, and using IT-TOOL. You must upgrade to V4.51 before attempting to upgrade to V4.53b software. If this is the case, use step 6 to upgrade to V4.51
6. Using the Installation Tool File Control feature upload the V4.51 system software files to the media card.
 - a. MP20 Files:
 - i. MPS_v451.PGM
7. After the files have been uploaded, reboot the system.
8. The system will reboot to a default condition. Access KMMC 727 to verify that you are now running V4.51 Software.
9. Connect the Installation Tool to the system.
10. Using the Installation Tool, upload the system database from step 2.
11. When upload completes make a few test calls and verify that your database has been restored.
12. Login to the switch and complete a database backup.
13. Using the Installation Tool File Control feature upload the V4.53b system software file to the media card.
 - a. MP20 Files:
 - i. MPS_v453b.PGM
14. Reboot the system to load the V4.53b software and then connect with IT-TOOL.
15. Upload the database created in step 12 and after booting make a few test calls.
16. Complete another database backup to complete the process.

C. OfficeServ 7400:

1. Install the new Installation Tool software.
2. Connect the Installation Tool to the system and perform a full system download to save the database to your PC. Consult the Installation Tool User Manual if you are unsure how to connect to a system.
3. When the download completes, disconnect the Installation Tool.

Samsung Software Version 4.53b Availability

4. Using KMMC programming complete a backup of the system database with MMC 815. This is the emergency backup should anything go wrong.
5. If the current switch software is running lower than V4.51, you must upgrade to V4.51 before upgrading to V4.53b if using IT-TOOL. Putting the SD card in a PC and copying the V4.53b software will keep you from doing a double upgrade, V4.51 and V4.53b.
6. Using the Installation Tool File Control feature upload the V4.51 system software files to the media card if system is lower than V4.51
 - a. MPEV_451.PGM
7. After the files have been uploaded, reboot the system.
8. The system will reboot to a default condition. Access KMMC 727 to verify that you are now running V4.51 Software.
9. Connect the Installation Tool to the system.
10. Using the Installation Tool, upload the system database from step 2.
11. When upload completes make a few test calls and verify that your database has been restored.
12. Login to the switch and complete another database backup.
13. Then upload the software file MPEV_V453b.PGM to the switch with IT-TOOL.
14. If using the Conference Circuit Pack, you must upload LP40 Software V1.27 to operate the card correctly.
15. Reboot the switch and verify V4.53b software, then upload the switch database backup completed in step 12.
16. Make a few test calls to verify proper operation.

D. OfficeServ 7100: MP10a

1. Connect to GSBN and download the software V4.53b for the OS7100 Switch and the IT-TOOL V1.53a software. Update the IT-TOOL on your PC.
2. Connect the Installation Tool to the system and perform a full system download to save the database to your PC. Consult the Installation Tool User Manual if you are unsure how to connect to a system.
3. Install the new switch software by uploading the following files to the SD card using IT-TOOL.
 - a. AP1AV453b.PKG
 - b. CS1AV440.PKG
 - c. DS1AV453b.PKG
 - d. MS1AV718.PKG
 - e. RD1AV453b.PKG
 - f. RT1AV453b.PKG
 - g. WS1AV453b.PKG
4. After the files have been uploaded, reboot the switch and verify in MMC 727 that the software shows version V4.53b.
5. Upload the database backed up in step 2.
6. Access the Utility section and delete the old files.
 - a. AP1Axxxx.PKG
 - b. CS1Axxxx.PKG
 - c. DS1Axxxx.PKG

Samsung Software Version 4.53b Availability

- d. MS1Axxxx.PKG
 - e. RD1Axxxx.PKG
 - f. RT1Axxxx.PKG
 - g. WS1Axxxx.PKG
7. Complete another backup to complete the V4.53b upgrade.

E. OS7030 Switch Upgrade :

1. Connect to GSBN and download the software V4.53b for the OS7030 Switch and the IT-TOOL V1.53a software. Update the IT-TOOL on your PC.
2. Connect the Installation Tool to the system and perform a full system download to save the database to your PC. Consult the Installation Tool User Manual if you are unsure how to connect to a system.
3. Install the new switch software by uploading the following files to the Switch using IT-TOOL.
 - a. AP30V453b.PKG
 - b. CS30V441.PKG
 - c. DR30V453b.PKG
 - d. MS30V720.PKG
 - e. RD30V453b.PKG
 - f. RT30V453b.PKG
 - g. WS30V453b.PKG
4. After the files have been uploaded, reboot the switch and verify in MMC 727 that the software shows version V4.53b.
5. Upload the database backed up in step 2.
6. Access the Utility section and delete the old files.
 - a. AP30xxxx.PKG
 - b. CS30xxxx.PKG
 - c. DR30xxxx.PKG
 - d. MS30xxxx.PKG
 - e. RD30xxxx.PKG
 - f. WS30xxxx.PKG
7. Complete another Switch backup to complete this upgrade.

Samsung Software Version 4.53b Availability

TECHNICAL DOCUMENTATION

Technical documentation has been changed to support software version 4.53b. Please refer to [Product Bulletin 229 CNF 24 Release](#) and [Product Bulletin 230 Device Manager Release](#) for a detailed documentation list.

TRAINING AND CERTIFICATION

Main program software V4.53b for the OfficeServ 7000 Series systems does not require additional certification to obtain Technical Support. If you already certified on the OfficeServ 7000 Switches no new certification is required. It is highly advised that you include this detailed bulletin in you manuals as a convenient reference when installing or upgrading to V4.53b system software.

If you have any questions regarding this notice, contact your Regional Sales Manager, or your Customer Service Representative at the number provided below, or via email at BCS.Sales@samsung.com

Bulletin No.: 230_Device_Manager

February 7, 2011

Device Manager™ for OfficeServ 7000 Systems Embedded and Client Versions Now Available!

Samsung is pleased to announce the general availability of Device Manager (DM). This Windows™ application allows programming of OfficeServ 7000 Series system using a PC over a data network or modem. Device Manager is a replacement for Installation Tool. The GUI and menus are almost identical so navigating with DM will be virtually identical. Device Manager comes in two versions to fit your preferences and needs.

Embedded Version for OfficeServ 7200S, 7200 & 7400 with V4.53b or Higher

Unlike Installation Tool that must reside on your Laptop, Embedded Device Manager is automatically downloaded each time you connect to a 7200S, 7200 or 7400 system running V4.53b software. Use Internet Explorer 6 or higher to connect to the system. Create a folder in Internet Explorer "Favorites" for all your systems running V4.53b or higher. This is equivalent to Link Control in Installation Tool.

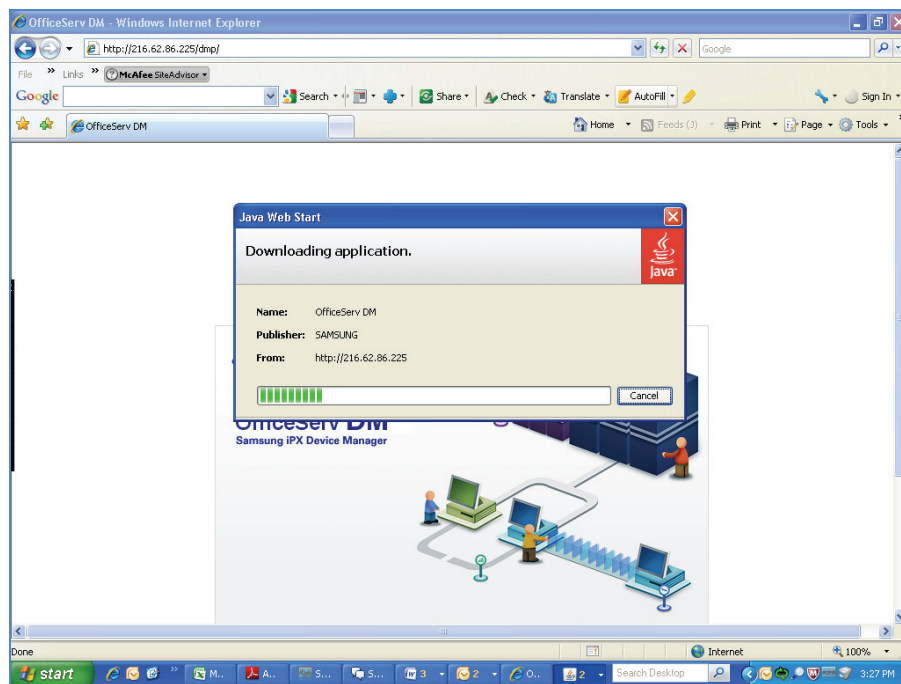

Technicians never have to worry about having the wrong version of DM. It comes with the MP software, so database version is always correct. No conversion process is required.

This new programming GUI is required to manage V4.53b software database and the CNF24 Meet-Me Conference Card. See separate Bulletin # 228.

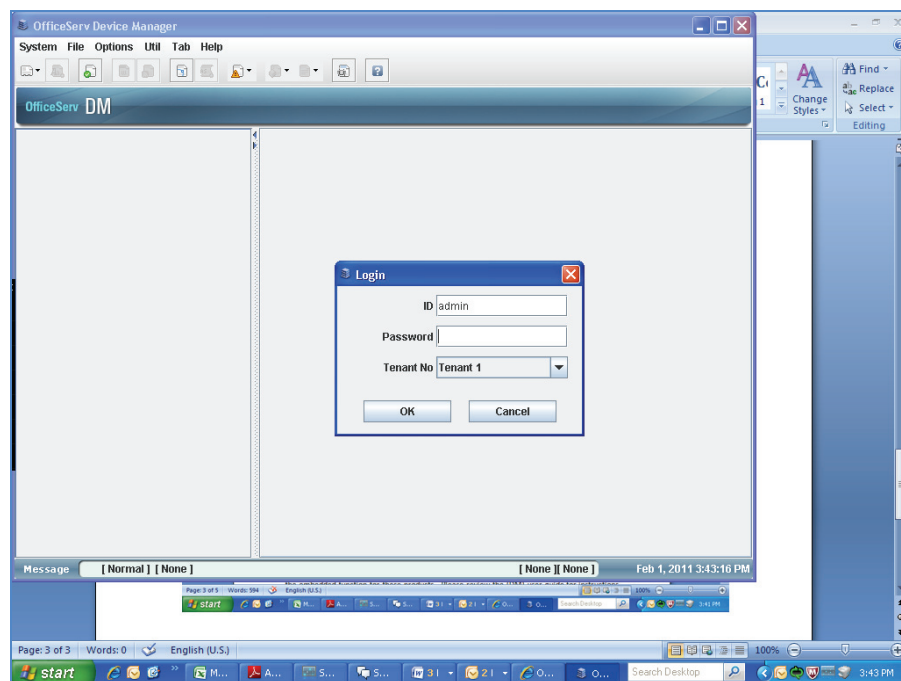

Samsung Device Manager—General Availability

Device Manager – Embedded Version

- Starts downloading as soon as you connect using Internet Explorer 6 or higher

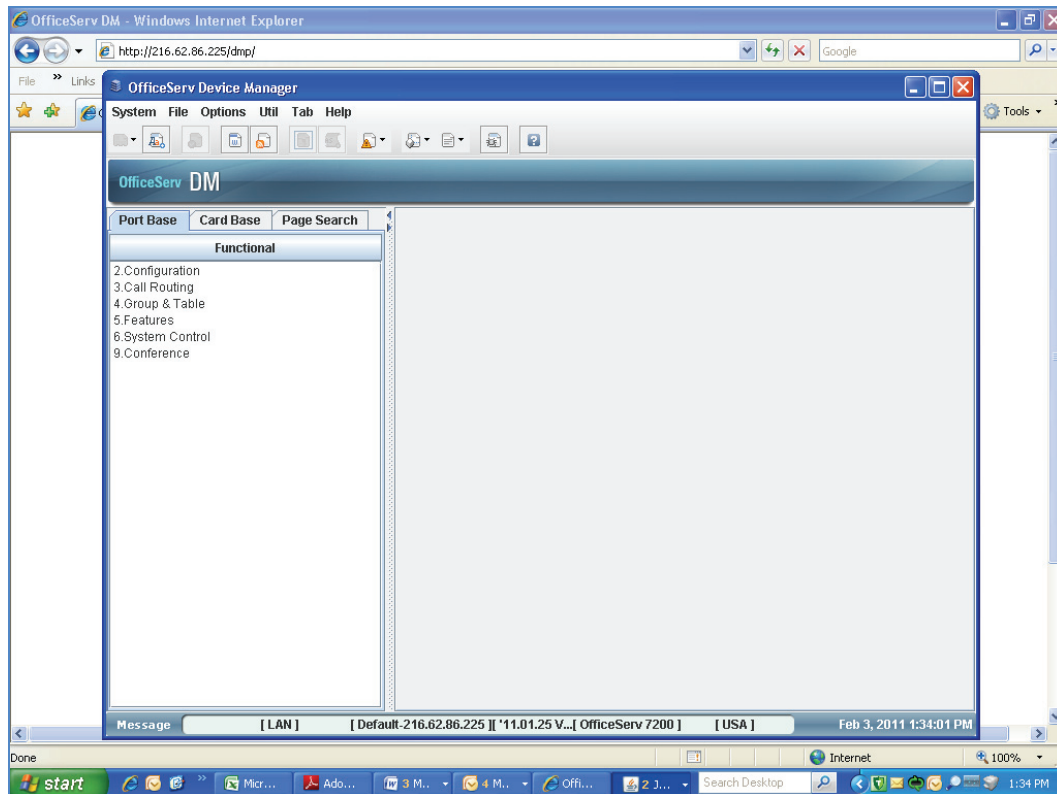

- When download is complete, a login window appears requesting ID & Password to access the system database.

Samsung Device Manager—General Availability

Device Manager – Embedded Version (Continuation)

- After database is downloaded

Samsung Device Manager—General Availability

Client Version for all OfficeServ 7000 Series Systems with V4.53b or Higher

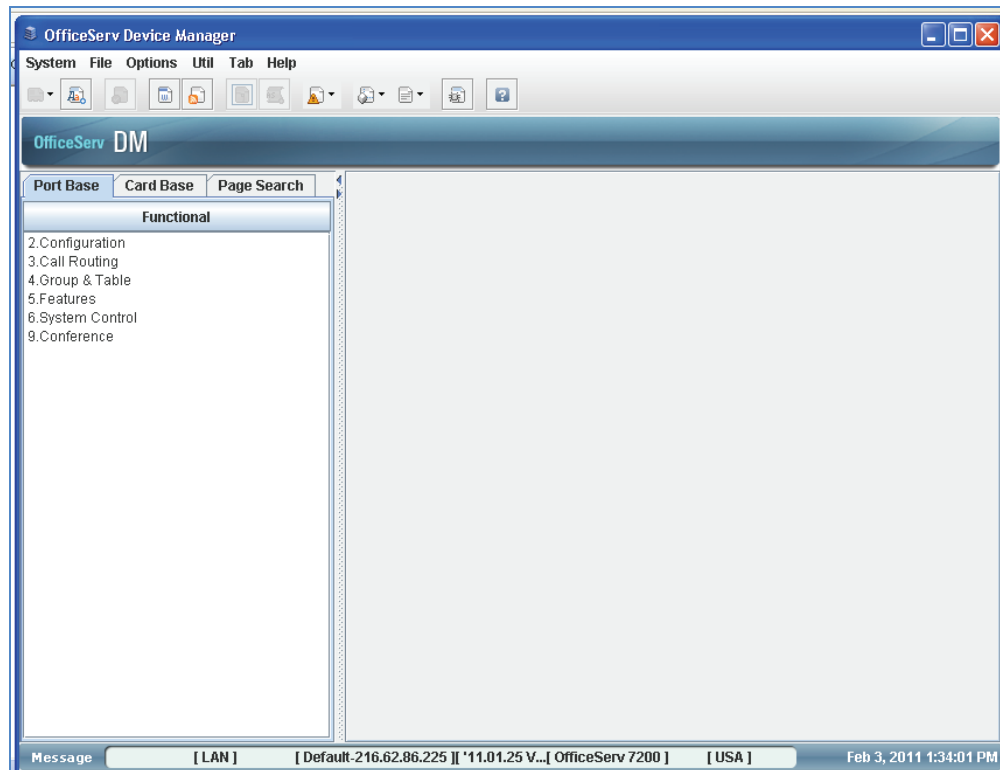

Just like Installation Tool this client version of Device Manager must be loaded on your laptop. Launch the application, create a new Link or select from the list already created to connect to the system. Device Manager GUI and menus are virtually identical to Installation Tool.

Client Version Icon

Device Manager – Client Version

- After login and database download.

Samsung Device Manager—General Availability

TECHNICAL NOTES

1. When downloading V4.53b for 7200 & 7400 from GSBN make sure to get both V4.53b plus the Device Manager zip files. The DM zip file includes the five files required for embedded Device Manager and Meet-Me Conference Personal Web page. Please review the Device Manager User Guide for instructions on adding this function.
2. Log in format is; `http://OfficeServ System IP Address/dm`, for Private Network or `dmp/*` for Public Network with NAT Routing.
3. The OfficeServ 7200-S requires the technician to log in using this format; `https://OfficeServ System IP Address/dmp/*`
4. When logging into Device Manager with `/dmp` format make sure Public Address is entered in the Public IP address field in MMC 830.

SYSTEM REQUIREMENTS

- **OfficeServ 7400:** V4.53b MP40 software dated 11.01.25. There is new folder on the SD media card called DM which will have the proper files included.
- **OfficeServ 7200 MP20:** V4.53b MP20 software dated 11.01.25. There is new folder on the SD media card called DM which will have the proper files included.
- **OfficeServ 7200s MP20S:** V4.53b MP20S software dated 11.01.25. There is new folder on the SD media card called DM which will have the proper files included.
- **OfficeServ 7100 MP10a:** Embedded Device Manager is not available with V4.53b. Technicians can use either Stand alone Device manager or Installation Tool V1.53a.
- **OfficeServ 7030:** Embedded Device Manager is not available with V4.53b. Technicians can use either Stand alone Device manager or Installation Tool V1.53a.

AVAILABILITY & PRICING

Effective February 7, 2011, all SD cards with V4.53b for 7200S, 7200 & 7400 shipping from our warehouse will include the embedded version of Device Manager.

Effective February 7, 2011 the Client version of Device Manager will be available for download from GSBN. The Client version can be used for all OfficeServ 7000 system running V4.53b or higher.

There is no cost for this new Device Manager.

Samsung Device Manager—General Availability

TECHNICAL DOCUMENTATION

The Device Manager User Guide will be available for download from the Global Samsung Business Network (GSBN) website, www.samsunggsbn.com.
