# PART 1. INTRODUCTION TO PROGRAMMING

## 1.1 PROGRAMMING OVERVIEW

The OfficeServ 500 system arrives from the factory with default data. Connect it to trunks, stations and power, turn the system on and it is fully operational. The only thing left to do is customize the data to fit the customer's needs. This is called programming the system.

MMC stands for Man Machine Code and each program is assigned a different three digit code. These MMC codes are used to view, create or change customer data. Programming is simply deciding what needs to be done and knowing which MMC is used to do it. For example, use MMC 601 to create a station group. System speed dial numbers are entered in MMC 705 and soft keys are assigned to individual keysets using MMC 722.

System programming may be done from any two line display keyset. The first thing you must do is open system programming. As a security measure, a passcode must be known to do this.

### • iDCS KEYSETS

This diagram illustrates the keys on a **iDCS 28 BUTTON** and a **iDCS 18 BUTTON keyset** that have special functions during programming. When required, these keys will be referred to by the names described in the diagram.

This diagram illustrates the keys on a **iDCS 8 BUTTON keyset** that have special functions during programming. When required, these keys will be referred to by the names described in the diagram.

## • DCS KEYSETS

This diagram illustrates the keys on a display keyset that have special functions during programming. When required, these keys will be referred to by the names described in the diagram.

- **ITP and DS 5000 Series KEYSETS**

This diagram illustrates the keys on **an ITP 5121-D keyset**. The ITP and DS 5000 keysets have keys that have special functions during programming. When required, these keys will be referred to by the names described in the diagram.

## 1.2 PROGRAMMING LEVELS

There are three levels of programming: SYSTEM, CUSTOMER and STATION. System and customer levels are under passcode protection while station programming does not require a passcode.

To prevent conflicting data from being entered, only one person at a time can enter programming with the technician or customer passcode. While programming is in progress, normal system operation is not affected. For your convenience, the system displays [xxx IN PGM MODE] when another keyset is in the program mode.

### A. System level

This level is entered via MMC 800 and requires the technician level passcode. It allows access to all system programs, station programs and maintenance programs.

### B. Customer level

This level is entered via MMC 200 and requires the customer passcode. It allows access to station programs and system programs allowed by the technician in MMC 802. When using the customer passcode to access station programs, data for all stations can be viewed or changed.

NOTE: When the system is programmed for multiple tenant use, each tenant has an individual customer passcode enabled in MMC 201. The access for tenant passcode is limited to only certain MMCs. [See MMC 201 for more details.](#)

After opening programming with the customer passcode, you must press TRSF to exit. Now press TRSF and the MMC number you wish to access.

### C. Station level

All keysets can access station programs 102–117 without using a passcode. Each user can only change station data for his/her own keyset.

When the LCD 24B keyset is in programming, the display shows instructions, prompts and choices. Existing data is always displayed before it can be changed. The keystroke sequence for each MMC is detailed in the following pages.

Before you begin entering customer data, follow this important reminder.

#### **IMPORTANT REMINDER**

When first installing this system, always use MMC 811 to reset and clear memory. This will ensure that you begin with clean default data.

Now begin entering customer data.

## 1.3 PROGRAM LIST IN NUMERICAL ORDER

## **PART 2. PROGRAM PROCEDURES**

### **2.1 OVERVIEW**

THE FOLLOWING INSTRUCTIONS FOR EACH MMC ASSUME THAT YOU HAVE ALREADY OPENED PROGRAMMING.

HELPFUL HINT:

When you are finished programming in MMC codes 100–855 and have other programming to do, press **SPEAKER** to exit the MMC but stay in the programming mode and use one of the following methods.

1. Dial another MMC code directly and continue programming.
2. Press **VOLUME UP** and **DOWN** keys to scroll through all MMC codes. When the desired MMC code is reached, press **SPEAKER** and continue programming.

Pressing **TRANSFER** will always save changes and exit the programming mode.

## MMC: 100

## STATION LOCK

### DESCRIPTION:

Allows the system administrator or technician to lock or unlock an individual station or all stations simultaneously. The three options are as follows:

- |   |                  |   |
|---|------------------|---|
| 0 | UNLOCKED         | Unlocks a locked station.   |
| 1 | LOCKED OUTGOING  | The keyset cannot make calls outside the system. It can however make and receive intercom calls and receive incoming C.O. calls. When in this mode the HOLD key of a DCS, iDCS, DS or ITP keyset will flash slow RED. |
| 2 | LOCKED ALL CALLS | The keyset cannot make or receive any calls. When in this mode the HOLD key of a DCS, iDCS, DS or ITP keyset will light steady RED.   |

### PROGRAM KEYS

## MMC: 101

## CHANGE USER PASSCODE

### DESCRIPTION:

Allows the system administrator or technician to reset any keyset's passcode to its default value of "1234." This MMC cannot display station passcodes; it can only reset them to default.

Keyset users can set or change their individual passcodes. The passcode is used to lock or unlock the keyset for toll restriction (call barring) override and to access the DISA feature.

NOTE: Default passcodes cannot be used for toll restriction override or for DISA access.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

### ACTION

## MMC: 102

## CALL FORWARD

### DESCRIPTION:

Allows the system administrator to program the call forward destinations for other station users. This MMC also allows call forward to be set after the destination has been entered.

The OfficeServ 500 system allows five types of call forwarding: FORWARD ALL, FORWARD NO ANSWER, FORWARD BUSY, FORWARD FOLLOW ME and FORWARD DND. There is an additional option, FORWARD BUSY/NO ANSWER, that allows both of these options to be activated at the same time, provided that destinations have been entered for both. Destinations for forward types 1, 2, 3 and 5 can be internal or external numbers.

0 = FORWARD CANCEL  
1 = ALL CALL  
2 = BUSY

3 = NO ANSWER  
4 = BUSY/NO ANSWER  
5 = FORWARD DND

0 = FORWARD CANCEL

This option will cancel any call forwarding set in MMC 102. It will not remove the programmed destination and will not override any preset forward settings in MMC 316.

1 = ALL CALL

This option, when set, will forward all calls to the programmed destination. If the programmed destination is a station then that station can call the forwarded station to put calls through.

2 = BUSY

This option, when set, will forward calls to the programmed destination when the forwarded keyset is busy.

3 = NO ANSWER

This option, when set, will forward calls to the programmed destination if the forwarded station does not answer a call before the forward no answer timer in MMC 502 expires.

4 = BUSY/NO ANSWER

This option will activate both the BUSY option and the NO ANSWER option at the same time.

5 = FWD DND

This option will forward all calls to the programmed destination whenever the forwarded station goes into DND.

## SET ANSWER MODE

### DESCRIPTION:

Allows the system administrator to change the answer mode of any keyset or DCS 32 Button Add-On Module (AOM). Each keyset or DCS 32 Button AOM can have its answer mode set to one of the following options:

0. RING: The keyset will ring in one of eight custom ring patterns. Calls are answered by pressing the ANS/RLS key or by lifting the handset.
1. AUTO: After giving a short attention tone, the keyset will automatically answer calls on the speakerphone. When a C.O. line is transferred to a keyset in Auto Answer, the screened portion of the call will be Auto Answer, but the keyset or AOM will ring when the transfer is complete if the user has not pressed the ANS/RLS key or lifted the handset.
2. VOICE: The keyset will not ring. After a short attention tone, callers can make an announcement but the ANS/RLS key or handset must be used to answer calls.

### PROGRAM KEYS

**MMC: 104****STATION NAME****DESCRIPTION:**

Allows the system administrator or technician to enter an 11-character name to identify an individual station.

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

# STATION SPEED DIAL

## DESCRIPTION:

Allows the system administrator or technician to program the personal speed dial locations assigned to a station. This must be done for single line telephones because these stations cannot access programming. Each station may have up to 50 locations or bins assigned to it in MMC 606 Assign Speed Block. The speed dial bins are numbered 00~49 (or 000~049 if the SYSTEM SPEED BIN MAX = 950 in MMC 861). Each speed dial number consists of a trunk or trunk group access code followed by a separator and up to 24 digits to be dialed. These dialed digits may consist of 0~9, \* and #. If the system recognizes a valid trunk or trunk group access number, it will automatically insert the separator.

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry
B	Used to insert a flash code "F"

## MMC: 106 STATION SPEED DIAL NAME

### DESCRIPTION:

Allows an 11-character name to be entered for each personal speed dial location. This name enables the speed dial number to be located when the directory dial feature is used. The directory dial feature allows the display keyset user to select a speed dial location by viewing its name.

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial keypad as the previous character, press the UP key to move the cursor to the right.

## KEY EXTENDER

### DESCRIPTION:

Use this program to view the programmable keys assigned to keyset station. In addition, it allows the system administrator to assign key extenders to some keys that will make a general access feature key more specific. The feature keys that can have extenders are listed below.

FEATURE KEY	EXTENDER
ACC	Account code bin (000–999)
BOSS	Boss and Secretary (1–4)
CR	Voice Mail Call Record
CS	UCD Call Status (UCD group number)
DIR	Directory dial by name type (1–3)
DP	Direct Pickup (extension or station group number)
DS	Direct Station Select (station number)
FWRD	Call Forward (0–7)
GCONF	Group Conference (1–5)
GPIK	Group Pickup (01–99)
IG	IN/Out of Group (Station Group Number)
MMPG	Meet Me Page (0–9, *)
MW	Message Waiting (extension or station group #)
NS	Network Station
PAGE	Page (0–9, *)
PARK	Park Orbits (0–9)
RP	Ring Plan (1–6)
RSV	Room Status View (0–4)
SG	Station Group (500–549)
SP	UCD Supervisor (UCD group number)
SPD	Speed Dial (00–49, 500–999)
VT	Voice Transfer (VM Station Group Number)
PMSG	Programmed Station Text Messaging (01–20)
VM	Voice Mail Memo (extension or station group #)

# STATION ON/OFF

## DESCRIPTION:

Allows the system administrator to set any of the keyset features listed below.

FEATURES		DESCRIPTION
00	AUTO HOLD	Automatically places an existing C.O. call on hold if a CALL button, trunk key or trunk route key is pressed during that call.
01	AUTO TIMER	Automatically starts the stopwatch timer during a C.O. call.
02	HEADSET USE	When ON, this feature disables the hookswitch allowing a headset user to answer all calls by pressing the ANS/RLS button.
03	HOT KEYPAD	When ON, this feature allows the user to dial directory numbers without having to first lift the handset or press the SPEAKER button.
04	KEY TONE	Allows the user to hear a slight tone when pressing buttons on keyset.
05	PAGE REJOIN	Allows the user to hear the latter part of page announcements if keyset becomes free during a page.
06	RING PREF.	When OFF, requires the user to press the fast flashing button to answer a ringing call after lifting the handset.
07	NOT FOR USA	This field is reserved and can not be used for U.S. software.
08	AUTO CAMP-ON	Keyset users can allow intercom calls to camp-on to other keysets without having to press a CAMP-ON key.
09	NOT FOR USA	
10	AME PSWD	If this option is set to YES, station users who have AME set must enter their station password to listen to messages being left.
11	DISP SPD NAME	If this option is set to ON the user will have the name associated with the speed dial number shown in the display after the number has been dialed.

**MMC: 110**

FEATURES		DESCRIPTION
12	CID REVIEW ALL	If this setting is set to OFF the CID review list will only store CID information for calls that were not answered at the station and reject the information for calls that were answered. When set to ON all calls will be stored in the list.
13	SECURE OHVA	When set to OFF an OHVA will be heard through the keyset speaker rather than the handset.
14	NOT FOR USA	
15	AUTO ANS CO	When set to ON CO lines programmed to ring that keyset directly will auto answer if the keyset is programmed for auto answer in <a href="#">MMC 103</a> .
16	ENBLOCK 2LCD	<i>For ITP Phones with 2 Line Display</i> Set to ON will require user to press SEND button to make a call, it works like a cell phone. Enblock dialing must be enabled in <a href="#">MMC 861</a> .
17	STN NO RING	When ON all incoming calls will not ring at stations.

# ALARM CLOCK

## DESCRIPTION:

Allows the system administrator or technician to set or change the alarm clock/appointment reminder feature for any analog station. This must be done for single line telephones, as they cannot access programming. Three alarms may be set for each station and each alarm may be defined as a one-time or TODAY alarm or as a DAILY alarm, as described below. The TODAY alarm is automatically cancelled after it rings, while the DAILY alarm rings every day at the same time. Alarm numbers are 1, 2 and 3. In the case of Secondary Pair assignments (MMC 217) the alarm only rings the station that is programmed and does not ring the paired station.

Entry	Alarm Type
Dial 0	NOTSET
Dial 1	TODAY
Dial 2	DAILY

## PROGRAM KEYS

# ALARM REMINDER

## DESCRIPTION:

Allows the system administrator or technician to set or change the alarm clock/appointment reminder feature for any digital station, MMC 112 must be used for analog stations. Three alarms may be set for each station and each alarm may be defined as a one-time or TODAY alarm or as a DAILY alarm, as described below. The TODAY alarm is automatically cancelled after it rings, while the DAILY alarm rings every day at the same time. It is also possible to set a message to display when the alarm is sounded.

ENTRY	ALARM TYPE
DIAL 0	NOTSET
DIAL 1	TODAY
DIAL 2	DAILY

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

# TEXT MESSAGE

## DESCRIPTION:

This program allows the user to create or modify 16 character text messages for their personal use in response to an off-hook voice announcement (OHVA). Only the stations set to use text messaging in MMC 611 can create and use text messages. Each station can have up to 10 text messages.

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

# CONFERENCE GROUP

## DESCRIPTION:

This program defines the conference groups. Only 5112 ITP keysets and OfficeServ Softphone users that are set to use conference groups in Program 612 can access this MMC. One station can have up to 5 conference groups. The maximum number of members for one conference group will be 4, excluding the station itself.

In this MMC you assign each conference group a name, and then enter up to four members in each group. You can build up to 5 groups.

Conference group names are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

## CALLER ID / ANI DISPLAY

### DESCRIPTION:

Allows the technician to set the individual station display preference on a per station basis. Caller ID, ANI and ISDN CLI can be selected to either show the name, number first, or no display depending on the type of call. Caller ID, ANI and ISDN CLI displays have the following options:

- |                 |  |
|-----------------|--|
| 0. NO DISPLAY   | No Caller ID, ANI or CLI data will be displayed.   |
| 1. NUMBER FIRST | The Caller ID, ANI or CLI number received from the Central Office will be displayed first.   |
| 2. NAME FIRST   | The Caller ID name received will be displayed first. In the case of ANI or CLI the number must be programmed in the CID/ANI translation table (MMC 728). ANI does not provide names. |

## EXECUTIVE PRESENT STATE

### DESCRIPTION:

When inter-working with EASYSET, the state of executive stations can be displayed. This program sets the present state of executive that the user wants to show. Also, this program allows the executive/secretary function so the user can set the answer mode for when an executive calls up.

Allows the system administrator or technician to change the status of an executive station.

Note: You must assign BOSS/SECRETARY stations using MMC 303 before programming this MMC.

1. EXEC STATE: The text message programmed here is displayed when inter networking with Easyset.
2. STATE (IN): Easyset displays the message programmed here if EXEC STATE is set to "OTHERS (IN)" in item 1 above.
3. STATE (OUT): Easyset displays the message programmed here if EXEC STATE is set to "OTHERS (OUT)" in item 1 above.
4. ANS MODE: When a secretary calls executive station using the BOSS key; the executive station according to the settings for this option.

Status messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

## MMC: 202 CHANGE FEATURE PASSCODE

### DESCRIPTION:

Used to change the passcodes for the following features: RING PLAN, DISA ALARM, ALARM CLR, AA RECORD, DELETE, and WLI REGIST.

DIAL	OPTION	DESCRIPTION
0	RING PLAN	This is the passcode required to place the system in different ring plans (RP) or change the ring time override (RTO).
1	DISA ALARM	This is the passcode required to clear a DISA ALARM generated when the number of DISA attempts are exceeded.
2	ALARM CLR	This is the passcode required to clear an alarm sensor.
3	AA RECORD	This is the passcode required to record prompts for use with the AA ports on the Auto Attendant (DAAUP) card.
4	DELETE	Hotel / Motel feature passcode, required to delete entries from a guest or meeting room bill.
5	WLAN	This is the passcode to allow mobile stations to register to the WLI card.

NOTE: The passcode is four digits long. Each digit can be 0-9.

## ASSIGN UA DEVICE

### DESCRIPTION:

Assigns ringing device to be accessed when a Universal Answer (UA) key is pressed or the UA pickup code is dialed. UA assignment is made in MMC 601 Assign Station Group for a group and then the group is entered here. The device type is automatically determined by the directory number (DN) entered.

NOTE: Only one of the above options can be selected. If the ability to ring more than one item (e.g., all four external page zones) is required, a station group containing all four zone codes must be created.

### PROGRAM KEYS

## ASSIGN VM/AA PORT

### DESCRIPTION:

Enables SLI ports to be designated as NORMAL or VMAA. VMAA ports receive digits designated in MMC 726 VM/AA Options and also receive a true disconnect signal upon completion of a call. Only SLI cards, not key daughter boards, support disconnect signal. Do not make VMAA ports data; this will return them to a single line port and stop voice mail integration. VMAA ports have the equivalent of data protect written in the program and are protected against tones.

NOTE: This MMC is not used to assign voice mail card ports. Voice mail card ports are assigned as voice mail ports automatically when the OfficeServ 500 detects a voice mail card.

### PROGRAM KEYS

## ASSIGN ADD-ON MODULE

### DESCRIPTION:

Designates to which keyset a DCS 32 button Add-On Module (AOM) or 64 button module is assigned to and determines if an off-hook voice announce (OHVA) will be received via a DCS 32 button AOM (AOM only). OHVAED:YES allows off-hook voice announce to an AOM. There is no limit to the number of DCS 32 button AOMs that can be assigned in the system. The maximum number of DCS 32 Button AOMs and or 64 button add-on modules that can be assigned to a keyset is 4. An OfficeServ 500 system will support up to thirty-two 64 button modules.

NOTE: The 64 button modules do not have a speaker or microphone so they will not have the off-hook voice announce option.

## MMC: 210 CUSTOMER ON/OFF PER TENANT

### DESCRIPTION:

Allows the system administrator to set in system features on a per-tenant basis. Each system option has a corresponding dialing number, as listed below. All options toggle ON/OFF.

<b>00 DISA PSWD :ON</b>	When this option is set to ON a caller must enter a 7 digit DISA password when they call a DISA trunk. When it is set to OFF a passcode is not required and the caller has full access to all features allowed on this trunk.
<b>01 LCR ENABLE :OFF</b>	This option determines whether the system will or will not route outgoing calls based on the information in the LCR routing tables contained in MMC's 710, 711, 712 and 713. LCR access code must be assigned in Dial Numbering Plan (MMC 724). System default is NO.
<b>03 PERI UCD RPT :OFF</b>	<p>When this option is turned ON a UCD report for each UCD group is printed periodically for an external display panel. The format of the print out is ASCII format. The format is as follows: ~0=1=2=3=4=5=6=7=8=9\n\d</p> <p>~: smdi header =: delimiter 0: UCD group number (1-4 digits) 1: total answered call count (0=99999) 2: unanswered call count (0-99999) 3: all agents busy count (0-99999) 4: average ring time (0-99999 in seconds) 5: average call time (0-99999 in seconds) 6: total all busy (0-99999 in seconds) 7: current queue count (0-99999) 8: longest queue time (0-99999 in seconds) 9: average queue time (0-99999 in seconds) \n: new line \d: carriage return</p>
<b>04 CID CODE INSERT:ON</b>	When this option is ON the system will insert the digit "1" when receiving CID information. When OFF the digit "1" will not be inserted in the CID information. This option is tenant wide. In certain areas the central offices are using a 10 digit numbering plan for calls. This feature can reduce the number of LCR digit table inputs in those areas that use the CID display callback feature. System default is ON.

**MMC: 210**

<b>05 DISA MOH :OFF</b>	When this option is turned ON outside parties will hear trunk MOH instead of dial tone from the time the system answers a DISA trunk until the caller dials a digit. System default is OFF.
<b>06 TRANSFER MOH :OFF</b>	When this option is turned ON outside parties will hear trunk MOH instead of ring back tone from the time a transfer is completed until the call is answered by an internal party. System default is OFF.
<b>08 DID BSY ROUT :OFF</b>	When this option is turned on a DID call directed to a busy station will reroute to the operator if camp on is set to OFF in MMC 714. If the option is set to ON the call will re route to the destination in MMC 406 for that trunk.
<b>09 ALARM MOH: OFF</b>	When ON allows stations to hear MOH after answering an alarm reminder call.
<b>13 RECALL PICKUP :ON</b>	When this option is turned on a call recalling to a station can be picked up using Direct Call Pickup, Pickup Group and My Group features. This applies to held calls recalling and transferred calls recalling to a station.
<b>14: ICM EXT FWD :OFF</b>	When this option is on call forward external is allowed when intercom calls are placed to a station that has Call Forward External programmed and set.
<b>16: DID ERR TONE :OFF</b>	This option was added to provide error tone when an invalid DID number is received. The OfficeServ 500 error tone should not be sent to the public network in the USA.
<b>24 TRSF CANCEL :OFF</b>	When turned OFF a single line phone will be able to handle 2 calls simultaneously. Using the hook-flash to toggle between them. When turned ON a single line telephone will be able to connect to the 2 <sup>nd</sup> call, but pressing the h/f will not toggle between the two calls it will disconnect the 2 <sup>nd</sup> call and reconnect the single line telephone to the first call.
<b>32 ISDN PROGCON:OFF</b>	This option, when ON, determines if the system will wait for an answer signal before allowing DTMF to be sent on an ISDN circuit. (L Version Only)
<b>36 DSS KEY DPU :OFF</b>	When set to ON, the station can make a directed call pickup, by pressing the flashing DSS key of the ringing station.
<b>37 BEGN DGT DSP :ON</b>	When ON and an outside call is made via speed dial or LNR where more than 11 digits are dialed, then only the first 11 digits dialed are shown on the keyphone display. When OFF, the last 11 digits are displayed.

## MMC: 210

<b>38 ONE TCH FACC: ON</b>	When ON, then a station may enter an account code using a one touch account code (ACC) key. When OFF, then a station must enter an account code by dialing via dial-pad before making an outside call.
<b>39 SGR ALL OUT :ON</b>	This option, when on, allows all members to log out of a station group.
<b>40 CHAIN FWD :ON</b>	When ON and a call is directed to a station that may be forwarded to another station that is call forwarded to a VMAA, then the caller will be directed to the last station's mailbox it reached. When OFF, then the caller will be directed to the first station's mailbox instead of the last.
<b>41 TRK MONITER :ON</b>	When set to ON, a barging party maintains the trunk connection, when the barged station goes on hook. When set to OFF, and the barged station goes on hook, all parties are disconnected.
<b>42 VoIP MFRALOC :OFF</b>	When set to ON, a DTMF receiver is assigned for VoIP tandem calling when a VoIP incoming trunk is connected to a VoIP outgoing trunk. Note: Except when H.245 signal mode is being used.
<b>43 NTWK AUTOTMR:OFF</b>	This option only affects systems with LE software and controls whether an intercom call across the network link will have the auto timer come on when the call is received.
<b>46 PERI UCD SIO:OFF</b>	When this option is set to ON the PERI UCD date is sent to the UCD port type of SIO port service, instead of the PERI UCD port type.
<b>48 REDIAL REVW:OFF</b>	When set to ON, this option will allow the user to review the last number dialed before dialing.
<b>53 PRE FWD BUSY:OFF</b>	When set to ON this option makes the preset forward no answer setting in MMC 316 act as forward on BUSY/NO ANSWER.
<b>54 ORG DIAL LOG:ON</b>	When this option is set to ON all digits dialed from a phone will be saved in the log.
<b>55 TIE TRSF RCL:ON</b>	When this option is set to ON a call transferred over a TIE line will no answer recall back to the originating station.
<b>56 VOIP REALRBT:OFF</b>	If this option is set to ON the MGI channels will provide the ringback tones.
<b>57 CO-CO TM ALL:OFF</b>	NO DESCRIPTION AVAILABLE.

**MMC: 210**

<b>58 SMDR AUT2 ACC:OFF</b>	When using authorization codes over 4 digits (maximum 10) set this option to ON and the authorization code will print in the Account Code field of SMDR. When set to OFF only the first four digits of any authorization code will appear in the AUTH field of SMDR.
<b>59 IPNW REAL RB:OFF</b>	When set to OFF the Ring Back tone on network calls will be generated from the originating MCP2 card. When set to ON, the distant MCP2 card provides both Ring Back tone on network calls.
<b>60 TRK AUTO MOH:OFF</b>	Turn this option ON to have the system immediately answer an incoming call and play the AA (Auto Answer) source set in MMC 408.
<b>61 TRSF VT KEY:ON</b>	Turn this ON to make the TRANSFER key act like a VT key. It will buffer digits dialed then send to Voice Mail after hanging up. Example: While on a call press TRANSFER, dial the Voice Mail Group number, then mailbox number, then hang up. OFF = normal TRANSFER key operation.
<b>62 PAIR NO RING:OFF</b>	When set to OFF a call to a busy station paired with another will ring at the paired station. Turn this ON and a call to a busy station paired with another will not ring at the paired station.
<b>63 DISA NO ACT:OFF</b>	Turn this ON to disconnect a caller to the DISA line when they take no action before the DISA NO ACTION TIME in MMC 501.
<b>64 ICM AUTO HOLD:OFF</b>	Set this option to ON to have intercom calls follow AUTO HOLD ON/OFF option in MMC 110.

## MMC: 214 DISA ALARM RINGING STATION

### DESCRIPTION:

Assigns the DISA alarm to ring at a specific phone. It is recommended that the person who can clear the alarm also receives the notification. There can be two distinct stations for notification. A valid destination can be either a station group or an individual station. The alarm ringing station or group will follow the ring plan time destination.

# DIAL BY VOICE OPTIONS

## DESCRIPTION:

Use this MMC to configure the VDIAL PCB for two (2) channels and seven (7) users or one (1) channel and five (5) users. When changing channel configuration, you will be prompted to “clear RAM.” This is Dial by Voice RAM not the system RAM. Clearing the Dial by Voice RAM will prevent accidental usage of pre-recorded names. It is advised that you clear this RAM prior to assigning of users in MMC 216. VDIAL PCBs are numbered with odd numbers, e.g., the first VDIAL PCB in system is numbered 3551, (3552) and the second VDIAL PCB is numbered 3553, (3554). If only one channel is assigned, the even number (3552) will not appear in MMC 216.

NOTE: Requires optional hardware and/or software.

## STATION PAIR

### DESCRIPTION:

Assigns a secondary station to a keyset. This secondary station can be a keyset, a single line port, an AOM or ITP phone. It is recommended that the extension number for the secondary station should be blocked from receiving direct intercom calls in MMC 314 to prevent the secondary station being accidentally called. The secondary station assumes the COS (Class of Service), LCR COS, and DND attributes of the primary station.

Note:

1. If the COS is changed for either station in MMC 301 the change affects both stations.
2. Secondary stations when dialed will also ring the primary extension.
3. Message from secondary extension will display that (secondary) extension numbers. Callback to extension (secondary) as well.

## MMC: 219 TRAFFIC REPORT PRINTOUT

### DESCRIPTION:

This MMC is used to print a traffic report and select options. The traffic report can be printed upon demand, every hour, at a programmed time of each day, or up to three separate timed shifts. Automatic printing will always clear the totals.

When MANUAL PRINTOUT is selected, the options are:

- PRINT AND CLEAR: A report is printed and all totals are reset to 0.
- PRINTOUT ONLY: A report is printed and all the totals are saved.
- CANCEL PRINTOUT: The program can be exited here if no report is needed.

When AUTO PRINT OPTN is selected, the options are:

- AUTO PRINT OFF: Reports are not automatically printed.
- DAILY HHMM:2359 A report is printed at this programmable time every day and all the totals are reset to "0."
- EVERY HOUR MM:00 A Traffic report will be printed every hour at this time
- THREE TIME SHIFT: Up to three separate Start and End times may be programmed to report traffic within certain times of a day. A report is printed at the end of each End time and all totals are reset to "0."

When a report is printed, the totals represent call statistics accumulated from the date of the last report stated as BEGINNING: D & T up to the date of this printout stated as ENDING D & T. See the sample report at the end of this MMC.

If there are no trunks in a group, the trunk group report for that group will not print.

### PROGRAM KEYS

## EXTENSION TYPE

### DESCRIPTION:

*This is a Hotel / Motel software specific MMC.*

This MMC enables station ports to be defined for a specific use. Each telephone can be designated as being one of the five (6) following types.

- 0 = Normal
- 1 = Guest Smoking
- 2 = Guest No Smoking
- 3 = Meeting
- 4 = Administrator
- 5 = Fax Station

Note: Each station type has a pre-designated COS associated with it. Administrator and Normal stations will be assigned COS 1. Meeting rooms will automatically be assigned COS 2, and guest rooms will automatically be assigned COS 3.

COS 2 and 3 have been configured with limited options appropriate for the specific type of room, (these pre-configured options may be changed by the technician, as desired).

- |                     |   |
|---------------------|---|
| 0. NORMAL STATION   | This is the default setting. The phone will operate as a normal / business station when assigned as this type. Ports designated as VMAA in MMC 207 must be designated as normal in this MMC.                    |
| 1. GUEST SMOKING    | When a station is designated as this type it will appear in room status and check in features as a smoking room. It will also be subjected to room billing structures and other Hotel/Motel specifications.     |
| 2. GUEST NO SMOKING | When a station is designated as this type it will appear in room status and check in features as a non smoking room. It will also be subjected to room billing structures and other Hotel/Motel specifications. |
| 3. MEETING ROOM     | When a station is designated as this type it will have the same attributes as guest rooms with regard to cleaning and occupied status but will not be displayed while scrolling through room status lists.      |

## MMC: 221

They will also be subjected to room billing structures and other Hotel / Motel specifications.

### 4. ADMINISTRATOR

Only stations designated as administrator stations can use the Hotel/Motel features such as check in, check out, etc.

### 5. FAX STATION

When a single line station is designated as this type the station can be used as a fax machine.

## WAKE-UP AA

### DESCRIPTION:

This MMC allows an AA message to be played when the wake up call feature is utilized. When the station rings, at the designated time and the guest answers, a message will play to the guest. The main concept for this feature is to utilize one of the 48 end user recordable greetings. However, any of the 64 available AA messages may be used.

This feature offers a busy overflow destination. In the event that the AA group is busy, the guest would receive MOH upon answering the wake up call.

It is recommended that the wake up AA recording be the last of the custom recordings in the list. This limits the amount of re-recording necessary, should the end user wishes to change the wake up announcement.

This MMC has three options:

Option	Description
AA GROUP	Determines which AA group will be connected when a Wake Up call is answered. This destination can be any AA groups.
MESSAGE NO	Determines which message will be played when a Wake Up call is answered. This destination can be a custom recorded message (1-48) or one of the pre-programmed messages (49-64).
GROUP BUSY	Determines which tone source will be connected when AA group members are all busy. This destination can be a NONE, TONE or extern music on hold.  If NONE is set then dial tone is connected, if TONE is set then hold tone is connected.

## MMC: 300 CUSTOMER ON/OFF PER STATION

### DESCRIPTION:

Allows the following features to be enabled on a per-station basis.

ACCESS DIAL	Determines whether a user can select a trunk or trunk group by dialling its directory number (DN). This selection should be turned to off when using LCR.
MICROPHONE	This option allows or denies the use of a keyset's microphone if equipped.
OFF-HOOK RING	Will allow a short burst of ring tone to indicate another call.
SMDR PRINT	When the station is set for no C.O. calls to and from this station, the station will not print on SMDR. This includes transferred calls or calls picked up from hold or park.
TGR ADV.TONE	When this feature is set to ON, a warning tone will be heard each time LCR advances to the next route.
VMAA FORWARD	<p>This feature selects whether C.O. calls can be forwarded to voice mail.</p> <p>ON = Permits forward to voice mail. OFF = No forward to voice mail.</p>
INTRCOM SMDR	When the station is set to OFF, the station will not print intercom calls on SMDR.
FWD OVERRIDE	When set to OFF intercom calls from this station will not follow the call forwarding of the called station.
RECL TO OPER	This option determines if a transferred call will recall to the transferring station (OFF) or to the operator (ON).
SLT LP OPEN	This option only applies to single line ports. When this option is set to ON the SLT port will receive a Loop Open Disconnect if the calling or called party hangs up before the SLT. This option does not affect ports set as DATA or VMAA in MMC 207/208, these ports will always receive a disconnect regardless of this setting.

## MMC: 300

**CID TO SLT:** System provides Caller ID to SLT. OfficeServ 500 requires an RCM2 board.

**NO RCL FLASH:** If ON and an SLT hook flashes and does not dial and hangs up, then the call will disconnect. If OFF the call will recall. The same applies if a keyset transfers and hangs up without dialling a station. Typically not used in the US market.

# ASSIGN STATION COS

## DESCRIPTION:

Used to assign class of service to each keyset. There are 30 different classes of service that are defined in MMC 701, Assign COS Contents. There are 6 ring plans based on the Ring Plan Time in MMC 507 that can apply to the COS. Classes of service are numbered 01–30. Default COS is COS 01.

Note: Check if Secondary Stations are in use MMC 217. Caution should be taken when changing COS for these stations. If either Primary station or Secondary station COS is changed then the “mated” station is also changed.

## ASSIGN FORCED CODE

### DESCRIPTION:

This MMC allows only one of the four options to be selected; the assignment of account code with verification, account code without verification, authorization codes, or none on a per-station basis or on an all-station basis. The system supports 500 authorization codes and 999 account codes that are verified when account codes verified is selected. If account codes without verification are selected, then there will be no table used.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC

## MMC: 308 ASSIGN BACKGROUND MUSIC SOURCE

### DESCRIPTION:

Assigns a background music source to the keysets. There are 6 possible music selections depending on the number of MISC daughter boards that are installed in the system.

You may also select an Auto Attendant (AA) port to provide continuous play of a specific recording. The AA port selected must be the last port on the card. If selected, the BGM source will be the message defined in MMC 736 from the port defined in this MMC.

For example, if this MMC selects 201's music source as 3966 (the last port on the second AA card) and MMC 736 selects Message 20 for the second AA card, when extension 201 is placed on hold, 201 will hear message 20 from the second installed AA card.

If you have an SVM Voice Mail System installed you may also select an SVM recording as a music. The recording must already been defined in MMC 748 and will show up here as the SVM port assigned with the recording.

## MMC: 309 ASSIGN STATION MUSIC ON HOLD

### DESCRIPTION:

Assigns a Music on Hold source to the OfficeServ 500 family of keysets. Any MOH source may be selected. There are two (2) external music sources provided per MISC daughter board.

In addition to the TONE or external music source from a MISC daughter board, you may also select an AA port to provide continuous play of a specific recording. The AA port selected must be the last port on the card. If selected, the Music on Hold will be the message defined in MMC 736 from the port defined in this MMC.

For example, if this MMC selects 201 music source as 3966 (the last port on the second AA card) and MMC 736 selects Message 20 for the second AA card, when extension 201 is placed on hold, 201 will hear Message 20 from the second installed AA card.

If you have a SVM Voice Mail System installed you may also select an SVM recording as a music source. The recording must already been defined in MMC 748 and will show up here as the SVM port assigned with the recording.

## **MMC: 315    CUSTOMER SET RELOCATION**

### **DESCRIPTION:**

Customer Set Relocation allows System Administration level or Technician level access to relocate or exchange similar stations in the OfficeServ 500 without wiring changes (see Allow Table below). This program is a one for one exchange with like stations. All individual station assignments such as trunk ring, station group, station COS, station speed dial, button appearances, etc. will follow the Customer Set Relocation program. iDCS 18 button keysets and iDCS 28 button keysets can be exchanged. Add On Modules and 64 button modules can also be exchanged. If incompatible set types are selected the system will provide an ERROR: NO MATCH message. If AOM or 64 button module units are to be exchanged the Master assignment must be removed prior to using Customer Set relocation. If the AOM or 64 button module Master station is not removed the error code ERROR: NOT ALONE will appear on the LCD display. A station must be in the idle state (on hook) to perform Customer Set Relocation. If a wired location has a station port connected but no telephone instrument the Customer Set Relocation program will allow set relocation as long as the station types are similar.

iDCS 18 button and iDCS 28 button key assignments should be taken in consideration when relocating these types of sets due to the button configurations of the instruments. If a 18 button set and a 28 button set are exchanged using the Customer Set Relocation program the first 18 buttons on the 24 button set will have the button programming of the 18 button set. In other words, when exchanging 18 and 28 button set only the first 18 buttons will swapped.

NOTE: Customer access to this feature is default OFF in MMC 802.

## PRESET FWD NO ANSWER

### DESCRIPTION:

Allows a technician to assign a default destination for FNA to each station on the system. These destinations may be different for each station or they may be the same. The preset destination will be temporarily overwritten if the station user enters a different FNA destination. If the user cancels the new destination, the preset destination will once more be in effect. If a station user has a FNA key, the LED will not indicate Preset Forward No Answer. Preset Forward No Answer time follows the station forward no answer timer. There is also an option (OPT) to select whether the forward applies to internal calls (I), outside calls (O) or both (BOTH).

Notes: This destination must be internal to the system. External numbers cannot be programmed. You must set PRE FWD BUSY to ON in MMC 210 for this feature to work.

## MMC: 317 TIME/COST DISPLAY OPTION

### DESCRIPTION:

This MMC determines if a display keyset will show the duration of the call in progress or the cost of the call in progress. Each station can set this option for either TIMER or COST.

**TIMER:** The duration of the call in progress will show in the upper right corner of the keyset display. The duration is in minutes and seconds. The cost of the call will not be shown.

**COST:** The cost of the call in progress will show in the upper right corner of the keyset display. The cost of the call is in dollars and cents. The duration of the call will not be shown.

This MMC cannot be selected by the station user. It must be set by using either the technician or customer passcode.

## MMC: 400 CUSTOMER ON/OFF PER TRUNK

### DESCRIPTION:

Assigns several options (listed below) on a per-trunk basis.

#### OPTIONS

0	1A2 EMULATE	When this option is set to ON up to 4 internal stations can participate in a conversation on this trunk by pressing the trunk key.
1	TRK INC. DND	When this option is set to ON a trunk that is programmed to ring a specific station (a private line or DIL) will ring at that station if the station is in DND.
2	TRK FORWARD	When this option is set to OFF this trunk will not follow a ringing stations call forwarding.
3	EFWD EXT CLI	Uses station CID when forwarding external C.O. lines.
4	REPEAT CLI	When set to ON the CLI information sent out of this system on a tandem trunk call will be the CLI information received on the incoming segment of the tandem call. When OFF the CLI sent out of this system on a tandem trunk call will be generated by this system.
5	TONECHK DISC	When this is set to ON, loop trunks can be disconnected by detecting busy tone (LP TRK TONE DISC must be ENABLE in MMC 861 for this feature to work).
6	AUTO ANSWER	When ON, auto answer mode can be assigned on a per-trunk basis.

## MMC: 408 ASSIGN TRUNK MOH SOURCE

### DESCRIPTION:

Allows the system administrator to set two MOH options for each trunk in the system.

Option 1: MOH—this selects which Music On Hold source will be heard on each trunk when it is put on hold.

Option 2: AA—this selects which Music On Hold source will be heard when the trunk is automatically answered by the system. See [MMC 210](#)-Trunk Auto MOH, ON/OFF. This feature must be set to ON before the AA option will take effect.

For the five types of selection for Options 1 and 2 see below.

### OPTIONS

1. TONE: An intermittent tone is played to the caller.
2. NONE: No Music on Hold selection.
3. 37X: If X is one (1), a chime tune is played. If X is another number, an external source from a MISC daughter board as assigned below is played.

MISC CARD	CABINET #	HARDWARE ITEM	MISC FUNCTION # MMC 724	DEFAULT DN (Port)
1	1	BGM/MOH Source	01	372
1	1	BGM/MOH Source	02	373
2	2	BGM/MOH Source	01	374
2	2	BGM/MOH Source	02	375
3	3	BGM/MOH Source	01	376
3	3	BGM/MOH Source	02	377

4. 39XX (when AA is used): The MOH source is provided by the AA card. [See MMC 736.](#)
5. SVM PORT NUMBER: If you have a SVM Voice Mail System installed you may also select a SVM recording as a music source. The recording must already been defined in MMC 748 and will show up here as the SVM port associated with the recording.

## MMC: 410

## ASSIGN DISA TRUNK

### DESCRIPTION:

Allows the system the ability to have Direct Inward System Access (DISA). Because there is a possibility that unauthorized calls will be made via this feature, several safeguards have been added. The end user must be informed of these to prevent unnecessary service calls. DISA can lockout when a predetermined number of invalid consecutive calls are attempted. Callers will then receive error tone until the programmable timer has expired. The \* key may be used to initiate new dial tone while in a station to station call. The # key may be used to terminate the DISA call and disconnect the central office line. DISA lines must be assigned to the Ring Plan(s).

## MMC: 414 ASSIGN CALLER ID / ANI TRUNKS

### DESCRIPTION:

Allows the system administrator or technician to activate Caller ID or ANI on a per-trunk basis. Activating Caller ID or ANI will delay the incoming ring indication at the operator by two ring cycles to allow for the collection of the calling party data.

Each trunk has the following options:

- |   |           |                                |
|---|-----------|--------------------------------|
| 0 | NORMAL    | This is not a Caller ID trunk. |
| 1 | CID TRUNK | This is a Caller ID trunk.     |
| 2 | ANI TRUNK | This is an ANI trunk.          |

NOTE: ANI information can be received only on digital (T1) trunks.  
ANI is programmed for use on a trunk group basis.

## REPORT TRUNK ABANDON DATA

### DESCRIPTION:

Allows the system administrator or technician to enable or disable the reporting of abandoned C.O. calls for which CID, CLI or ANI information has been collected on a per-trunk basis. There are two options for this MMC as follows:

- |               |   |
|---------------|---|
| 0 REPORT: NO  | Abandoned call records for incoming calls with CID or ANI information will not be printed on SMDR or stored in the system call abandon list. These records will continue to be stored in the station review list. |
| 1 REPORT: YES | Abandoned call records for incoming calls with CID or ANI information will be printed on SMDR and stored in the system call abandon list. These records will also be stored in the station review list.           |

NOTE: In order for these abandoned call records to print on SMDR, MMC 725 SMDR OPTIONS Option 11 Print Abandoned Call Records must be set to YES.

## E&M/DID RING

### DESCRIPTION:

This MMC defines which ring destination an E&M or DID trunk will follow for incoming calls. There are three options for each trunk as defined below.

- 1. FOLLOW INCOM DGT** When a trunk is set to this option calls will ring at the destination that matches the digits received from the CO. This is the same as the current UNUSE DID TRANS option. It will operate like an E&M Tie Line.
- 2. FOLLOW DID TRANS** When a trunk is set to this option calls will ring at the destination defined in MMC 714 that matches the digits received from the CO. This is the same as the current USE DID TRANS option. This is used when E&M Tie Line (both way DID Service) are used to provide DID service.
- 3. FOLLOW TRK RING** If this option is selected, press the right soft key and [No. REV DIGIT:00] will appear on the display. Here is where the number of incoming digits from C.O. must be entered (00 through 16). When a trunk is set to this option calls will ring at the destination defined in MMC 406 for that trunk. If the destination defined in MMC 406 is a VMAA port or group then the system will repeat the digits received from the CO to the VMAA port when it answers.

## DISTINCTIVE RINGING

### DESCRIPTION:

Allows the technician to assign the ring tone be sent by the calling station or trunk to the called (receiving) station. There is also a cadence control option to perform a similar function for single line sets. There are eight ring tones available for the phones. There are 5 cadences for SLT's.

It also allows the technician to assign the call priority for a group call when called by a specific station or when a specific trunk rings that phone. When calls into station group come and group members are all busy, the system will assign a priority to a specific station or a specific station or a specific trunk so that calls from a high priority call will be placed at the front of the group queue. If this option is set to NO, the longest call that placed at the group queue has the highest priority. There are 9 priority levels: priority 1 is the highest and priority 9 is the lowest.

<b>tone option</b>	<b>DESCRIPTION</b>
NO	Calls will ring with the digital phone users choice of ring frequency.
1~8	Calls from the programmed station or trunk will ring phones with this ring frequency.

<b>CADENCE OPTION</b>	<b>DESCRIPTION</b>
NO	Calls will ring with the normal SLT ring cadences.
1	Calls from the programmed station or trunk will ring SLT's with the intercom ring cadence.
2	Calls from the programmed station or trunk will ring SLT's with the CO ring cadence.
3	Calls from the programmed station or trunk will ring SLT's with the DOOR ring cadence.
4	Calls from the programmed station or trunk will ring SLT's with the ALARM ring cadence.
5	Calls from the programmed station or trunk will ring SLT's with the CALLBACK ring cadence.

## ANI / DNIS OPTIONS

### DESCRIPTION:

Provides a flexible means of setting in band digits to allow ANI (Automatic Number Identification) and DNIS (Dialed Number Identification Service) when used in conjunction with each other. These settings are defined on a per trunk group basis. The inband signaling string is as follows: Separator 1 (if used), DN1, Separator 2 (if used), DN2 and Separator 3 (if used). DN1 and DN2 fields must be flagged for either DNIS or ANI and the number of digits to be expected. ANI service is supported by digital T1 E&M tie line service only. The two digit call ID can be set as any two digits by selecting "AA" in the separator field. If additional wink signaling is to be received the separator "CC" should be used. "CC" allows for a wink that is not more than 400ms. Call digit strings and separators depend on the service provider. If "NONE" is set as a separator a 700ms delay or pause is allowed between the ANI fields. ANI is assigned on a trunk group basis.

Note:     AA = Don't care  
          CC = Wink 400 ms max.  
          NONE = 700ms pause max. (expect no digits)

The following options may be selected for ANI / DNIS operation:

- |                     |  |
|---------------------|--|
| 1. Separator 1      | This indicates the start of an ANI type call. Valid inputs include 0 to 9, *, # 2 digit call I.D. (0 to 9, *,#, AA) or NONE.             |
| 2. DN1              | Select ANI or DNIS use.  |
| 3. Number of digits | Select the number of digits to received. DNIS= 1-7, ANI= 1-10  |
| 4. Separator 2      | This is the separator between the ANI or DNIS digits. Valid inputs include 0 to 9, *, #, 2 digit call I.D. (0 to 9, *,#, AA) CC or NONE. |
| 5. DN2              | Select ANI or DNIS use.  |
| 6. Number of digits | Select the number of digits to be received.  |

## MMC: 420

### 7. Separator 3

This separator indicates the close of digits being sent on an ANI / DNIS call. Valid inputs include 0 to 9, \*, #, CC or NONE.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options

## COST RATE

### DESCRIPTION:

In this MMC, the TRUNK COST RATE flags are entered for each trunk. The per trunk cost rates are defined in MMC 729 Rate Calculation Table. The dialed digits Costing Plans are defined in MMC 730. Each trunk may be defined with up to eight cost rates. Enter one or more of the eight COST RATES per trunk. If an entry is left blank, no call costing will be calculated for that particular DIAL PLAN.

Call type 8 is fixed for incoming. Apply a cost rate under type 8 only to a trunk if you want incoming call costing.

## BRI OPTION

### DESCRIPTION:

Assigns several options on a per-BRI basis and there are different options depending on whether the BRI is programmed as a trunk or station in MMC 427.

NOTE: If any changes are made in this MMC, the BRI card that is affected by these changes **MUST** be restarted using MMC 424 in order for the changes to become effective.

#### OPTIONS FOR BRI PORTS PROGRAMMED AS TRUNKS IN MMC 427

0	ANY CHANNEL	When this option is set to YES, the system will place calls on any free channel of that BRI if the channel chosen by the user is busy. If set to NO, the user will receive a busy signal if they attempt to access a busy channel even if the other channel on that BRI is free.
1	BRI MODE	P-P DID Point to Point Direct Inward Dial. This operates in a similar manner to an analog DID circuit with multiple CO numbers pointed to a single channel and translated within the system (MMC714) to a single device. This mode is not used in the U.S.
	P-M NOR	Point to Multi-point NORmal. This type of circuit operates in a similar manner to P-P NORmal but allows multiple devices to be attached to the circuit. Ringing is defined in MMC 406. This mode is not used in the U.S.
	P-M MSN	Point to Multi-point MSN. This setting is used when the line uses the MSN supplementary service. Ringing is defined in MMC 426. This is the U.S. default mode of operation.
	P-P NOR	Point to Point NORmal. This operates like a standard telephone line with one CO number per channel and ring according to MMC 406. This mode is not used in the U.S.

## MMC: 425

- |   |        |         |   |
|---|--------|---------|---|
| 2 | DLSEND | OVERLAP | Digits will be sent as they are dialed by the user. This is the usual setting for the U.S. operation.                       |
|   |        | ENBLOCK | Digits will be collected and sent in a single block similar to a Cell phone. This setting is generally not used in the U.S. |
| 3 | SWH    |         | The ISDN protocol you wish to run on this BRI circuit (e.g., NI_2, 5ESS10, DMS100).   |
| 4 | TIMER  |         | The ISDN T200 and T300 series timer values (note: do not change these since defaults are correct for U.S. operation).       |

### OPTIONS FOR BRI PORTS PROGRAMMED AS STATIONS IN MMC 427

- |   |             |  |
|---|-------------|--|
| 0 | ANY CHANNEL | When this option is set to YES, the system will place calls on any free channel of that BRI if the channel chosen by the user is busy (i.e., Preferred channel selection). If set to NO, the user will receive a busy signal if they attempt to access a busy channel even if the other channel on that BRI is free (i.e., Exclusive channel selection). |
| 1 | POWER FEED  | This is set to NO for all U.S. applications.   |
| 2 | SWH         | The ISDN protocol you wish to run (e.g., NI_2, 5ESS10, DMS100).  |
| 3 | TIMER       | The ISDN T200 and T300 series timer values (note:do not change these since defaults are correct for U.S. operation).   |
| 4 | CLI TABLE   | This refers to the table in MMC 321 that will be used for Calling party number (the CLI that is sent).   |

## MMC: 426

## BRI SPID / DN

### DESCRIPTION:

This MMC is used by the technician to assign the Service Profile Identifiers (SPIDs) and the Directory Numbers (DNs) to the Basic Rate Interface (BRI) circuits on the P4BRI card. It assigns an incoming MSN call to up to six ring plan station or station group destinations. Also, it provides a call waiting option, if needed, so that a second incoming MSN call can be received. There are two MSN entries for each trunk and each can have up to six ring plan destinations, a call waiting option, and an accept/reject option.

**NOTE:** The options in this MMC apply to BOTH channels of a BRI circuit. If you change the settings for one channel the settings for the other channel on that BRI will automatically change as well.

OPTION	DESCRIPTION
--------	-------------

SPID	This is the Service Profile Identifier number which is used to specify the type of service (e.g., incoming, outgoing, bothway) and service attributes (e.g., voice only, data only, voice and data), etc. available on this facility.
DN	This is a CO number associated with this circuit. Each circuit can have up to two CO numbers of up to ten digits in length.
1-6	These numbers correspond to the six ring plan destinations (maximum) for this MSN. The destinations can be either stations or station groups.
CW	Call Waiting (i.e., if the destination is busy will the call camp on or give an audible BUSY tone signal).
OPT	ACCEPT - this setting will allow incoming calls to follow the previously entered ring plan destination data  RJECT - this option will reject all incoming calls to this circuit.

## MMC: 430

## PRI CONTROL

### DESCRIPTION:

This MMC allows the technician to program a TEPRI trunk card, which has been designated as a PRI. The normal mode of operation for a PRI facility in the US is DID (i.e., shown as DDI in this MMC) service for incoming calls and senderized operation (i.e., the switch provides dial tone, collects the called number digits, and then places the call) for outgoing calls. The only useful mode of operation for a U.S. PRI is the DDI (i.e., DID) mode. Further, the default Timer settings are appropriate for the U.S. and should not be changed unless you are instructed to do so by the Samsung Product and/or Technical Support Departments.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

### OPTION TABLE

#### ANY CHANNEL:

YES = Preferred channel selection (i.e., another idle channel may be used for this call if this channel is initially selected);

NO = Exclusive channel selection (i.e., only this channel may be used) for this call if this channel is initially selected)

**PRI MODE:** DDI = the only valid U.S. selection (U.S. DID mode); NORMAL = don't use in the U.S. (same as the T1 trunk per channel mode)

#### CH. SELECT:

HIGH = hunt for a channel from the highest numbered channel to the lowest when making an outgoing call;

LOW = hunt for a channel from the lowest numbered channel to the highest when making an outgoing call

#### SWH:

The ISDN protocol you wish to run (e.g., NI\_2, 5ESS10, DMS100, NI\_1, Bellcore 5ESS5, 5ESS9)

## MMC: 430

**USE CHANNEL:** the number of provisioned ISDN “B” channels on the PRI (range: 1-23)

**TIMER:** ISDN T200 and T300 series timer values (note: do not change these since defaults are correct for U.S. operation)

**CLI TABLE:** This refers to the table 1-4 in MMC 321 that will be used for Calling party number (the CLI that is sent).

## CONNECTION STATUS

### DESCRIPTION:

This read only MMC will confirm the connection status of stations or trunks. Display status actually displays the status of a station or trunk at the time requested. If a conference is in progress with the selected trunk or station the display will show one of the conference parties and an arrow (→). The technician or system administrator can then display the next parties in the conference. If a station or trunk is in an idle state the display will show "NONE". If the station or trunk selected is not a valid selection the display will show "INVALID DATA". If the station or trunk is made busy by the CPU the display will show "MADE BUSY". If the station is in busy state with no other connection, the display will show "BUSY" only.

## SYSTEM-WIDE COUNTERS

### DESCRIPTION:

Used to set the values of the system counters. The counters are listed below with a brief description of each.

- |                     |   |
|---------------------|---|
| 0 ALARM REM. CNTER  | The number of times that an alarm reminder will ring a station before cancelling. RANGE = 1-99. (Also used for wake up calls).  |
| 1 AUTO RDL COUNTER  | The number of times the system will redial an outside number after the auto redial feature has been activated. RANGE = 1-99.  |
| 2 DISA CALL         | Sets the maximum number of intercom calls that can be made after accessing a DISA line. RANGE = 1-99.   |
| 3 DISA LOCK         | Number of attempts the system will allow to incorrectly access a DISA line before locking out the DISA line. RANGE = 1-99.  |
| 4 NEW CALL COUNTER  | Number of times the system will allow a user to signal New Call on a C.O. line during one call. RANGE = 1-99.   |
| 5 UCDS VISUAL ALARM | Used to set the Visual alarm threshold. It is triggered when the number of calls waiting to be answered in the UCD group reaches this value. The SP key will flash when this number of calls is queued to the UCD group. RANGE = 0-25.                        |
| 6 UCDS AUDIO ALARM  | Used to set the Audio alarm threshold. It is triggered when the number of calls waiting to be answered in the UCD group reaches this value. The SP key will flash and the phone will ring when this number of calls is queued to the UCD group. RANGE = 0-25. |
| 7 UCD CS LEVEL 1    | Provides call wait indication level 1 if number of calls waiting to be answered in UCD group reaches this value. CS keys will flash amber when this number of calls is queued to the UCD group. RANGE = 0-25.   |

## MMC: 500

### 8 UCD CS LEVEL 2

Provides call wait indication level 2 if number of calls waiting to be answered in UCD group reaches this value. CS keys will flash red when this number of calls is queued to the UCD groups. RANGE = 0-25.

### PROGRAM KEYS

## TIMER DESCRIPTIONS

<b>AA INT DGT TIME</b>	When the AA card is installed, this timer determines the interdigit time for AA call processing. If this timer expires before valid digits are received by the AA card, the call will be routed to the AA invalid digits destination.
<b>AA NO ACT TIME</b>	When the AA card is installed, this timer determines the time that the AA card will wait for a first digit for AA call processing. If this timer expires before a digit is received, the call will be routed to the AA no action destination.
<b>ALARM TIMER</b>	This is the time the system alarm key will start ringing after the alarm key has been silenced.
<b>ALERT TONE TIMER</b>	This timer sets the duration of the attention tone preceding a call to a keyset in the Voice Announce or Auto Answer mode. This tone will also precede a forced Auto Answer call.
<b>ALM REM INTERVAL</b>	This timer controls the time length between ring attempts at a station when alarm reminder is set. (Also used for wake-up calls).

## MMC: 501

<b>ALM REM RING OFF</b>	This timer controls the length of the ring cycle duration when alarm reminder is set at a station. (Also used for wake-up calls).
<b>ATT RECALL TIME</b>	This is the length of time a transfer recall (hold or transfer) will ring at an idle station before recalling the operator.
<b>AUTO REDIAL INT</b>	This timer controls the time between attempts after RETRY dialing is set on a station.
<b>AUTO REDIAL RLS</b>	This timer controls the duration of a Ring No Answer condition on a retry number dialed before the auto redial is automatically canceled.
<b>CALLBACK NO ANS</b>	This timer controls the time before the callback is automatically canceled when a callback detects Ring No Answer.
<b>CAMP ON RECALL</b>	This timer controls the duration of time a camped-on call will stay at a destination before recalling to the transferring station.
<b>CID MSG RECEIVE</b>	The amount of time that the system will allow a valid message from the C.O.
<b>CID DSP ALLOC TM</b>	
<b>CID DISPLAY TIME</b>	The amount of time that the Caller ID information remains on the keyset's display.
<b>C.O.-C.O. DISCONNECT</b>	This timer monitors the duration of an unsupervised conference; when it expires, both trunks are disconnected.
<b>CONFIRM TONE TIME</b>	The tone heard when a feature is activated or deactivated.
<b>CRD TONE INT TM</b>	This is the call record tone interval time. An entry other than zero will cause a tone to be heard by all the parties in a recorded conversation. The range for the tone is 001 (every second) to 255 (every 255 seconds). A value of 000 means no tone. Requires CADENCE/SVMi-8E/SVMi-16E card.
<b>DIAL PASS TIME</b>	This timer monitors the duration of time before connecting the transmit of the keyset to the trunk side of an outgoing call.
<b>DISA DISCONNECT</b>	This timer controls the maximum duration of a DISA call.

## MMC: 501

<b>DISA DTMF DETECT</b>	This timer sets the time duration that DTMF can be received on a DISA line.
<b>DISA LOCK OUT TIMER</b>	This timer controls the duration of time a DISA call is not allowed to be made after the DISA error counter has expired (MMC 500).
<b>DISA NOANS DISC.</b>	
<b>DISA PASS CHECK</b>	This timer defines the time period before the system clears the incorrect passcode counter.
<b>DISA NO ACTION</b>	
<b>DISPLAY DELAY TIMER</b>	This timer controls the duration a display is shown in the LCD display. This timer also controls the duration of time that error tone is heard.
<b>DOOR LOCK RELEASE</b>	This timer controls the duration of time the door lock relay will be activated.
<b>DOOR RING DETECT</b>	This timer controls the duration of time before a call is answered by the door phone.
<b>DOOR RING OFF TM</b>	This timer controls the duration of ringing at the door ring destination before automatically canceling.
<b>E-HOLD RECALL TM</b>	This timer controls the duration of time a call is held exclusively at a station before recalling.
<b>FIRST DIGIT TIME</b>	This timer controls how long the system will wait for dialing to begin before dropping the dial tone and returning the user to error tone.
<b>HOK FLASH MAX TM</b>	This timer monitors the duration of a hookswitch flash to ensure that the flash is valid and not a line noise or an accidental hookswitch bounce (LONGEST DURATION).
<b>HOK FLASH MIN TM</b>	This timer monitors the duration of a hookswitch flash to ensure that the flash is valid and not a line noise or an accidental hookswitch bounce (SHORTEST DURATION).
<b>HOOK OFF TIME</b>	This timer controls the time before dial tone is sent to a single line station.
<b>HOOK ON TIME</b>	This timer sets the minimum amount of time that the system will recognize as an SLT hang up.

## MMC: 501

<b>INQUIRY RELEASE</b>	This timer monitors the duration of the interaction of the soft key to determine when to return the LCD back to a normal status. This timer affects only display phones.
<b>INTER DIGIT TIME</b>	This timer controls the grace period between dialing valid digits before dropping the call and returning the user back to error tone.
<b>ISDN INTERDIGIT TIMER</b>	This timer controls the grace period between dialing valid digits and the end of the dialing string on an ISDN call.
<b>KMMC LOCKOUT TIMER</b>	This timer controls the grace period between programming actions while in a programming session. The timer automatically returns the system to secure programming status.
<b>LCR ADVANCE TIME</b>	This timer controls the duration of time before selecting the next allowable route when a station is allowed to route advance.
<b>LCR INTER DIGIT</b>	This timer controls the grace period between dialing valid digits before accessing a trunk.
<b>LONG KEY DETECT</b>	This timer controls the time a key must be held down before the key press is repeated.
<b>LONG KEY REPEAT</b>	This timer controls the time between repeated digits on a long key press.
<b>MS LED ON TIME</b>	This timer controls the duration a Manual Signalling key will remain on after use.
<b>OFF HOOK RING INTERVAL</b>	This timer controls the duration of time between ring bursts to a user who has a camped-on call.
<b>OHVA ANSWER TIME</b>	This timer controls the time duration of an OHVA call before automatic rejection.
<b>PAGE TIME OUT</b>	This timer controls the duration of a page announcement.
<b>PAGE TONE TIME</b>	This timer controls the duration of tone burst heard over the page prior to the page announcement.
<b>PARK RECALL TIME</b>	This timer controls the duration of time a call is parked before recalling to the call park originator.

## MMC: 501

<b>PC-MMC LOCK OUT</b>	This timer monitors the PCMMC/OfficeServ™ Manager (OSM) activity, drops the link if no action is created by PCMMC/OfficeServ™ Manager (OSM) and returns the system back to secure program status.
<b>PERI-UCD REPORT</b>	This timer is the interval that a periodic UCD report is provided to an SIO port.
<b>POWER DOWN TIME</b>	This timer monitors the power to the ROM pack to begin shutdown status.
<b>RECALL DISCONNECT</b>	This is the time an attendant recall will ring before being disconnected.
<b>RECALL WAIT TIME</b>	This is the time any recall (hold or transfer) to a busy station continues to wait at the station before recalling to the operator.
<b>ROUTE OPTIMIZE</b>	
<b>SMDR START/DIAL PULSE (ROTARY)</b>	This grace period timer starts SMDR recording for rotary dialing. This timer also controls the LCD duration timer on the keysets. The duration time displayed and the SMDR time duration will be the same.
<b>SMDR START/DTMF</b>	This grace period timer starts SMDR recording for touchtone dialing. This timer also controls the LCD duration timer on the keysets. The duration time displayed and the SMDR time duration will be the same.
<b>SYS HOLD RECALL</b>	This timer determines the time calls can be left on hold before recalling back to the holding station. This is a system-wide timer. Setting timer to 000 will defeat this feature and no recalling will take place.
<b>TRANSFER RECALL</b>	This timer determines the time transferred calls ring before recalling. This is a system-wide timer.
<b>TRK AUTOMOH DISC</b>	
<b>TSW CONN. DELAY</b>	This timer determines the length of time before the audio path is connected to a CO line after seizure via LCR.
<b>UCDS AUDIO ALARM</b>	When an AA card is installed and the digital UCD package enabled, this counter determines the maximum number of seconds a call has been waiting at the UCD group before the UCD group's SUPV key begins to flash along with an

## MMC: 501

audio alarm. For more UCD alarm conditions, [see MMC 500](#).

### UCDS VISUAL ALARM

When an AA card is installed and the digital UCD package enabled, this counter determines the maximum number of seconds a call at the UCD group before the UCD group's SUPV key begins to flash as an alarm. For more UCD alarm conditions, [see MMC 500](#).

### VOIP RE-ROUTE TM

When the outgoing call is made via VOIP trunk and does not receive a message from the called party within this time, the call is disconnected.

## MMC: 502

## STATION-WIDE TIMERS

### DESCRIPTION:

Allows certain station timer values to be changed on a per-station basis or for all stations.

- |                |  |
|----------------|--|
| 1 NO ANS FWD   | This timer controls how long the station will ring before Forward on No Answer takes place. (Range: 001- 250 sec.)   |
| 2 DTMF DUR.    | This timer governs the duration of DTMF digits which are transmitted to an external VM system port. This can be used when a VMS system fails to recognize the default DTMF digit duration being transmitted from the DCS SLT port. (Range: 100- 9900 m sec.) |
| 3 F - DGT DELY | This timer will be valuable for the system administrator to insert a suitable delay before generating DTMF digits for In Band Integration. (Range: 00- 9900 m sec)   |
| 4. OFFHK SEL   | This timer controls the grace period before placing an internal/external call as programmed in MMC 306. (Range: 000- 250 sec.)   |
| 5. EFWD DELAY  | This timer controls how long a station will ring before the call is forwarded to an external number. (Range: 000 – 250 sec.)   |
| 6. CC RNG DLY  | When the station does not answer incoming call within this time, other stations with the CC key of that station will ring together. This feature only applies to the station call and station group call does not serviced (Range: 10 sec)                   |

### PROGRAM KEYS

## TRUNK-WIDE TIMER

### DESCRIPTION:

Allows certain trunk timer values to be changed on a per-trunk basis or for all trunks. It is not advisable to change these values, with the exception of trunk Flash Time, without assistance from Technical Support.

<u>TIMER</u>	<u>DESCRIPTION</u>
--------------	--------------------

ANS.BAK TM	ANSwer BAcK TiMe. This timer is used for certain types of E&M signaling and does not affect normal CO lines.
CLEARING	This timer ensures that a call is fully disconnected at the CO by preventing CO access outgoing or receiving incoming ring between a disconnect and the expiration of this timer.
CO SUPV TM	CO SUPerVision TiMe this is the minimum length of loop open disconnect received from the CO that will be seen as a valid hang up on the system.
DTMF DUR.	DTMF DURATION This is the length of the DTMF digits that will be sent to the CO on this line.
F-DGT DELY	First DiGiT DELaY This is the length of time the system will wait for CO line conditions to stabilize after seizure before sending DTMF digits.
FLASH TIME	This is the duration of the momentary open sent on a circuit flagged as PBX in MMC 401.
NO RING TM	This is the length of time the system will wait after detecting a ring burst on a line before deciding the call has disconnected.
PAUSE TIME	This is the length of time the system will wait before sending the next digit for a pause in a speed dial bin.
RNG DET TM	RiNG DETect TiMe This is the minimum length of ring signal the system will regard as a valid ring.
WINK TIME	This is the duration of the acknowledgment signal that the system will send on an E&M circuit.
MF/DP INT	This is the interval time between each sending digit. In the case of DTMF, if this time is set for 500 ms or more, then the time interval will be 100ms.

## MMC: 503

- MFR DLY TIME** This is a delay time before a receiver will listen for DTMF for incoming call. This timer should not be changed from its default value of 0 seconds.
- DISA ANSR** This is a delay time to answer the DISA trunk call or to answer the trunk when TRK AUTO ANSWER is set to ON (MMC 400).
- CONN DELAY** This is a delay time to connect voice path when the users make outgoing call via loop trunk. This is to prevent the user from hearing noise when loop trunk is seized.

### PROGRAM KEYS

- UP & DOWN** Used to scroll through options
- KEYPAD** Used to enter selections
- SOFT KEYS** Move cursor left and right
- SPEAKER** Used to store data and advance to next MMC
- ANS/RLS** Used to select ALL

### ACTION

1. Press TRANSFER 503.  
Display shows.
2. Dial trunk number (e.g., 704)  
OR  
Press UP or DOWN key to select trunk and  
press RIGHT soft key to move cursor  
OR  
Press ANS/RLS to select all trunks and  
press RIGHT soft key to move cursor.
3. Dial timer number from the list  
OR  
Press UP or DOWN key to select timer and  
press RIGHT soft key to move cursor.
4. Enter new timer value (must be four digits,  
e.g., 0700).  
System returns to step 2.

## TONE CADENCE

### DESCRIPTION:

Provides the ability to customize the tone cadence on a system-wide basis. There are ten tone cadences available. Please call Technical Support before changing any cadences as some systems may require default settings.

<u>tone name</u>	<u>description</u>
BUSY TONE	The called station is busy.
CONFM/BARGE	A feature has been successfully activated/cleared or a Barge In with Tone has been performed.
DIAL TONE	The system is ready to interpret key presses/dialed digits.
DND/NO MORE	The called station is in DND or has no free CALL buttons.
ERROR TONE	An error has been made.
HOLD/CAMPON	This is the system generated hold tone.
MSGWAT TONE	This is the dial tone heard at an SLT with a message waiting.
RGBACK TONE	The called station is ringing.
RING TONE	This is the CO ring cadence.
TRSFER TONE	This is the dial tone heard when the transfer key is pressed or an SLT hook flashes.
DID RGBACK	This is the ringback tone heard by the outside party when they dial a DID number.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options

## MMC: 507

## ASSIGN RING PLAN TIME

### DESCRIPTION:

Use this MMC to program Ring Plans time settings. Ring Plans provide six separate ringing destinations based on day of the week and time of day. The start time within a plan is the time the system will switch from one ringing destination to the next. The end time is the time the system will switch from that plan to the previous plan. A RPO (Ring Plan Override) key is not needed as the system will switch automatically; however, it is helpful to have a dedicated button so the status can be manually changed if needed. If a ring plan has no time entry the ring plan defaults to ring plan 1. The ring plans correlate with all MMC's that program ring or termination destinations and station and trunk COS.

Use the following example of assigning Ring Plans:

RING PLAN	START TIME	END TIME
(MON: 1)	ST: 0000	END: 23:59
(MON: 2)	ST: 0800	END: 2200
(MON: 3)	ST: 1000	END: 2000
(MON: 4)	ST: 1200	END: 1800
(MON: 5)	ST: 1300	END: 1600
(MON: 6)	ST: 1400	END: 1500

Using a 24 hour clock in the example above notice that the END time is within the same 24 hour period. The system will stay in the last active Ring Plan from the previous day until the end time which is 23:59. Monday starts the Ring Plan 1 at 00:00. The system will stay Ring Plan 1 until 08:00 and will stay in Ring Plan 2 until Ring Plan 3 starts. As each ring Plan start it will override the previous Ring Plan. If a Ring Plan ends and there are no additional Ring Plans the system will default to the Ring Plan with time that extends past the expired ring plan time.

Note 1: Ring Plans must be programmed in sequence. IE. RP 1,2,3,4 etc.

A Ring Plan cannot be omitted. IE. RP 1,2,5 etc.

A higher numbered Ring Plan cannot have a START time before a lower numbered Ring Plan.

Note 2: Ring Plan 1 is the default Ring Plan of each day. If no Ring Plan destination is input the operator group (500/5000) is the default destination.

## MMC: 511 MSG WAITING LAMP CADENCE

### DESCRIPTION:

This MMC defines the cadence (flash rate) of single line telephone message waiting lamps on phones connected to an 8MWSLI or a 16MWSLI card. There are two main choices for the MW lamp cadence available, these being continuous and interrupted as described below.

#### OPTION KEYS

- |               |   |
|---------------|---|
| 0 INTERRUPTED | The MW lamp will flash at a rate determined by the timer settings. The shortest on time is 100ms and the longest on time is 3000ms. The shortest off time is 100ms and the longest off time is 3000ms. The timer is adjusted in 100ms increments. |
| 1 CONTINUOUS  | When an 8MWSLI or a 16MWSLI port has a message, the lamp will be lit steady.  |

#### PROGRAM KEYS

- |           |  |

## HOTEL / MOTEL TIMERS

### DESCRIPTION:

*This is a Hotel / Motel software specific MMC.*

This MMC is where the check out time for guest rooms, the room clean timers, and the check in grace period timer are set. These are system wide timers that affect all rooms.

0 = CHECK OUT TIME  
1 = ROOM CLEAN TIME  
2 = CHECK IN END TIME

**CHECK OUT TIME** If a room is occupied during the checkout time an additional days room charge will be automatically added to the room bill. If a room is flagged as HOLD the additional days room charge will not be added. (Setting a room status to HOLD is how a late check out can be performed.)

**ROOM CLEAN TIME** This is the time each day that the system will flag all occupied rooms as NEEDS CLEANING.

**CHECK IN END TIME** This timer is the beginning of the Check In Grace Period. Any room checked in after this time, and before the Check Out Time, will not be charged an additional days room charge, when the Check Out Time is reached.

## MMC: 601

## ASSIGN STATION GROUP

### DESCRIPTION:

This MMC is used to build all station groups. There are 40 programmable groups available in a OfficeServ 500-M system and 80 for a OfficeServ 500-L system.

The options for setting up these groups are as follows: A through F.

**A. TYPE:** This is the type of group you are creating and can be one of the following:

1. **NORMAL:** Used to assign stations in a ring group. The members can be stations, common bell contacts or Ring over Page relays.
2. **VMAA:** Used to group a number of voice mail port extensions. These must have been defined in MMC 207 as VMAA ports or they cannot be entered here. Check all programming in MMC 726 to ensure that the In band DTMF codes are properly set.
3. **UCD:** Used to build a UCD group. The OfficeServ 500 will support two methods of UCD:

- **TYPE 1 UCD**

The group OVERFLOW/N-ANS destination (see below) is defined as an SLT port to which you must connect some type of announcement device to play to callers while they are on hold.

Please note that this type of UCD group has the following limitations.

- a) The announcement device must be able to terminate the announcement with a hook flash and a transfer back to the UCD group.
- b) Only one caller at a time can hear the announcement.
- c) Each caller connected to the announcement must hear the announcement in its entirety.
- d) It is possible that a new caller may “jump ahead” in the queue if a previous caller is currently connected to the announcement device.

- **TYPE 2 UCD**

The group OVERFLOW/N-ANS destination (see below) is defined as an AA port or group. This will only work if an AA card has been installed in the system.

## MMC: 601

The digital announcer in the AA card will supply two recorded announcements to callers in queue. The first announcement is played only once, the second announcement will repeat for as long as the caller is in queue.

This type of UCD group has the following advantages:

- a) No external device need be installed to provide an announcement.
- b) Multiple callers can hear the announcement(s) simultaneously.
- c) Callers hearing the announcement will be transferred to a free UCD group member (agent) as soon as the agent becomes available.
- d) The callers place in queue is always maintained.

Additional programming for this type of UCD group is in MMC 607. There is a maximum of 20 UCD groups available on the system.

3. **AA:** This is used to group a number of AA ports. An Auto Attendant (AA) card must be installed in the system to do this.
  4. **BI-VMS:** This is the voice mail group for the built in Samsung Voice Mail Card. When a Voice Mail Card is installed, group 529 must be programmed as a BI-VMS group on an OfficeServ 500-M system and group 549 must be used for an OfficeServ 500-L system. Group 529 and 549 are fixed for the voice mail card use. If the voice mail card is not installed in the system, group 529 or 549 can be used as any other group can be used.
  5. **MESSAGE:** Used to group a number of extensions to serve as a message desk or message group. When one of the stations in this type of group leaves a message to another station the messaged station will return the message to the message group so any member can answer the call. If a station is a member of more than one message group, then any message indications made by that station would be for the first numerical message group they are a member of. It is not recommended to program stations in to multiple station groups.
  6. **SO STN GRP:** This is used to group a number of S0 stations for video conference.
- B. RING MODE:** Each group can have one of the following ring modes. This will decide how calls are placed to the group.
1. **SEQUENTIAL:** The stations listed as “members” (see below) will be called on a first available basis. Calls will first go to the first member, if the first member is busy, calls will go to the second member, if the second member

## MMC: 601

is busy, calls will go to the third member etc. This type of group is useful for placing the bulk of the incoming calls to a selected individual, with other members only getting the calls when the first member is busy. The number of members allowed for a sequential group is 48.

2. **DISTRIBUTED:** The first call will go to the first member, the second call will go to the second member, the third call will go to the third member. This type of group is useful for evenly distributing the call among all group members. The number of members allowed for a distributed group is 48.
  3. **UNCONDITIONAL:** Calls are placed to all group members simultaneously. This reduces the number of members of the groups to 32. If a group member is busy, they can receive off hook ring if defined in MMC 300. This ring mode option is not available for AA UCD or VMAA groups.
- C. OVERFLOW:** This is the timer value that will cause unanswered calls to a group to begin also ringing the NEXT PORT (see below) after this timer has elapsed. If set to 000, no overflow will take place.
- D. NEXT PORT:** This is the station or group number that callers will also ring at if the OVERFLOW feature has been programmed. The OVERFLOW DESTINATION can be defined as:
1. **COMMON BELL** There are 3 relays available in the OfficeServ 500 system that are defined as Common Bell.
  2. **RING OVER PAGE** This is defined by using the number of a page audio output.
  3. **STATION OR STATION GROUP.** Any station or station group can be defined as the NEXT port.
- E. GRP TRANSFER:** This is a timer that will determine how long C.O. calls transferred to the group will ring at the group before recalling. If set to 000, no recall will take place.
- F. MEMBER:** List all members that are to be in the group. Up to 48 members are allowed in each group, but stations can be assigned to multiple station groups.
- G. NXT HUNT:** The length of time a call will ring at a station before it hunts to the next group member.
- H. GROUP BUSY: OFF** When this option is set to ON an intercom caller will receive a busy signal when calling the group and all members of the group are busy. When this occurs then the overflow timer is bypassed as the group is not ringing.

## MMC: 601

**NOTES:** Calls to a group do not follow the call forwarding instructions of any stations in the group.

- I. **GRP AUTOANS: OFF** When this option is set to ON, intercom calls to the group will Auto Answer/Voice Announce if the station is programmed for Auto Answer/Voice Announce in MMC 103. CO calls will follow the AUTO ANS CO setting in MMC 110 for a group member in addition to the group members setting in MMC 103.

### FEATURE KEYS

0	TYPE	Group type (Normal, VM/AA, UCD, AA, BI-VMS, MESSAGE, SO STN)
1	RING	Ring mode (Sequential, Distributed or Unconditional)
2	OVERFLOW	Overflow time (000 - 250 secs.)
3	GRP TRSF	Group transfer time (000 - 250 secs.)
4	NEXT PORT	Group or station number (e.g. group 502, station 221, 244)
5	MEMBER	Group members (e.g., station 202, 225, 231)
6	NXT HUNT	Hunt time (000 – 250 secs)

### RING MODES

0	SEQUENTIAL	The first idle station listed in the group will ring. If the first is busy, the next idle station will ring.
1	DISTRIBUTED	The first call will ring the first station listed in the group. The next call will ring the next station listed in the group.
2	UNCONDITIONAL	All the stations listed in the group will ring. Busy stations will receive off-hook ring. MAXIMUM 32 STATIONS RINGING.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

**MMC: 602****STATION GROUP NAME****DESCRIPTION:**

Allows the system administrator or technician to enter an 11-character name to identify an individual station group.

Names are written using the keypad. Each press of a key selects a character. Pressing the next key moves the cursor to the next position. For example, if the directory name is SAMSUNG, press the number 7 three times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key changes the letter from upper case to lower case.

NOTE: When the character that you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move cursor left. A space can be entered by using these keys.

## ASSIGN TRUNK GROUP

### DESCRIPTION:

Allows the assignment of trunks to a specific trunk group or to several trunk groups. This is very useful in the programming of LCR when more than one trunk is to be in several dialing plans. There are two different modes of operation: (1) sequential and (2) distribute. There are 30 programmable trunk groups in a system with up to 99 members per group.

**WARNING:** One trunk can appear in more than one trunk group. If necessary, delete the trunk member from other groups to prevent accidental access.

### PROGRAM KEYS

## ASSIGN SPEED BLOCK

### DESCRIPTION:

Provides a means of adding or deleting speed dial blocks to the system or an individual keyset. With the ability to delete a block or blocks or speed dial, it will not be necessary to waste these on such items as voice mail, DPIMs or stations that do not require the ability to use speed dial. The Free List will show how many bins are left to be assigned. All entries refer to blocks of 10 numbers or bins.

A library of up to 2000 speed dial numbers may be allocated as needed on a OfficeServ 500-M system and 2500 for a OfficeServ 500-L system. These total library of numbers is split between the System Speed Dial list with the balance being shared between stations. The system list can be set for either 500 or 950 numbers using MMC 861. Each station can have up to 50 numbers. Speed dial numbers are assigned in blocks of ten. Each speed number may contain up to 24 digits.

### PROGRAM KEYS

## MMC: 607

## UCD OPTIONS

### DESCRIPTION:

Sets up UCD options when an AA card has been installed. MMC 601 must have already been used to define a UCD group with an overflow destination of an AA port or group. (A group is preferred over a port because a group allows multiple paths into the AA card and therefore has greater traffic handling capabilities.) When a group overflow timer in MMC 601 expires, the caller will be routed to the AA card. It is here that the caller is played the UCD "FIRST MESSAGE" and "SECOND MESSAGE" while in queue. This will continue until an agent becomes free or the caller is transferred to a final destination.

This MMC includes options to select messages to play to a caller. These messages can be as follows:

#### MESSAGES 01–48

These can be created using the AAREC key (programmed on keysets by using MMC 722 or 723). A total of two minutes of message time is available and can be divided up into 1 to 48 messages.

#### MESSAGES 49–64

These are pre-programmed as follows:

- 49 "Thank you for calling, please dial your party's extension number."
- 50 "Invalid number, please try again."
- 51 "I'm sorry, there is no answer."
- 52 "I'm sorry, that station is busy."
- 53 "One moment please."
- 54 "Transferring."
- 55 "I'll transfer you."
- 56 "Good-bye."
- 57 "Thank you."
- 58 "Please hold for the operator."
- 59 "Please hold for assistance."
- 60 "Thank you, good-bye."
- 61 "I'm sorry, all stations are presently busy."
- 62 "I'm sorry, all stations are still busy."
- 63 "Please call back later."
- 64 "I'm sorry, not a valid selection."

## MMC: 607

The following program options apply:

### FIRST MESSAGE

After the caller has overflowed from the UCD group, the first message will immediately play. For instructions on how to make these recordings, [see the User Instructions Section, Auto Attendant and Uniform Call Distribution System Administration](#). The default message is #61 "I'm sorry, all stations are presently busy."

This message will only be played once for the caller.

### SECOND MESSAGE

If no agent has become free after the UCD recall time (see UCD Recall), the caller will be played the second message. [For instructions on how to make these recordings, see the User Instructions Section, Auto Attendant and Uniform Call Distribution System Administration](#). The default message is #62 "I'm sorry, all stations are still busy."

This message will be repeated for as long as the caller is in queue, at an interval specified in the UCD Recall Timer below.

### EXIT CODE

While the caller is hearing a message (but not during MOH), the caller may dial the DTMF digit specified here and be transferred immediately to the final destination ([see Final Destination](#)). The exit code is optional and does not need to be used. If used, the first and second messages may be modified to provide instructions on its use.

### RETRY COUNT

The UCD program is designed to route a caller to a "final destination" after a programmable number of "loops" through the UCD message. The range of this counter is 0 to 99. 00 means that there is no retry counter and the caller will remain in the UCD queue until answered. Any non zero value will route a caller through the UCD loop that many times before going to the final destination. The UCD will route calls to the final destination immediately if all members of the group are either out of group or in DND.

Example: If this counter is set to 02, callers reaching a busy group will hear the first UCD message, be placed on hold, hear the second UCD message, be placed on hold, and finally hear the second message again before being transferred to the final destination. The default is 99.

## MMC: 607

### FINAL DESTINATION

This is the final destination for the caller if not answered by a UCD agent. This destination is only reached if (a) the caller dials an exit digit during a message or (b) the retry count has expired. The final destination can be any station number (in a network), any group number (within a network), a disconnect or another plan. Plans are entered by pressing key #19 (CONF) plus two digits 01–12. A disconnect is entered as a destination of NONE (HOLD key).

1. If the final destination is a voice mail port, the port will receive a FWD from UCD group integration message.
2. The final destination will forward or overflow, if the forward to destination is a voice mail port the port will receive FWD from UCD group integration message.
3. If the final destination is not forwarded, the call will ring or camp on to the final destination indefinitely.
4. The default final destination is 500.

To ensure that you do not get a situation where all the call buttons are busy on the final destination it is advisable to make the final destination a group (even if the group has only one station in it.)

### RING NEXT

This timer must be shorter than the overflow timer in MMC 601. If a higher value is entered, the display will show invalid entry. In the case where a UCD group has the ring next timer set at 000, an unanswered call will rotate evenly among all agents until it is answered. The UCD greetings will be heard during this routing process, but can be removed by defining the UCD messages in MMC 607 as unrecorded message numbers. This will simulate a circular hunt group. The default is 010.

### UCD RECALL

After a caller has heard a UCD announcement, he/she will be placed on hold until an agent becomes available or the UCD recall timer expires. When the UCD recall timer expires, the caller will again hear the UCD announcement. The range is 000–250. The default is 010.

### MUSIC ON HOLD SOURCE

This option determines what Music on Hold source the callers will be connected to between messages. The choice is either an external source, AA message defined in MMC 736 or a message site in SVM.

## MMC: 607

### WRAP UP

This option will make a UCD agent unavailable to receive additional UCD calls after hanging up from the last one. This is to allow agents to complete work associated with the previous call before the next call begins ringing. The range is 000-250. The default is 010.

### AUTO LOG OUT

This ON/OFF option determines if a station will automatically log out of the UCD group when the RING NEXT timer expires. This setting will be ignored if the RING NEXT timer is set to 000. This option is set to ON by default.

### ALLOUT→FINAL

This ON/OFF option determines if calls forward to the UCD final destination when all stations are logged out of the UCD group. If no UCD final destination is assigned then the call will disconnect. This option is set to ON by default.

### AGENT PIN NO

If an agent wants to enter a UCD group, specifies whether an agent code for UCD will be pressed.

### GBUSY NEXT

This ON/OFF option specifies if all agents are busy, specifies whether the next port is called immediately during overflow time.

## ACTION

1. Press TRANSFER 607.  
Display shows.
2. Press UP or DOWN to select UCD group or dial group number  
OR  
Press LEFT soft key to position cursor under message number and enter new message  
OR

## CALL LOG BLOCK

### DESCRIPTION:

Provides means of adding or deleting Call LOG blocks to an individual keyset. With the ability to delete a block or blocks, it will not be necessary to waste these on such items as voice mail, DPIMs or for keysets that do not have displays. The free list will show how many bins are left that be assigned. A system has 2000 bins.

## ALLOW TEXT MESSAGING

### DESCRIPTION:

This program allows the user to send a text message to a busy station or during an OHVA. Up to 100 stations can be set to use this feature. Each user is assigned a block of ten messages to program individually.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear entry
TRSF	To exit programming

### ACTION

1. Press TRANSFER 611.  
Display shows.
2. Enter the number of a station  
OR  
Press VOLUME to select the number of a station. Press RIGHT soft button to move the cursor.
3. Specify whether text message will be used or not. A message, "NOT USED: CAN'T" will be displayed on LCD if the Maximum number of stations is exceeded.
4. Press TRANSFER to exit the program.  
OR  
Press SPEAKER to move on to the next program.

## ALLOW GROUP CONFERENCE

### DESCRIPTION:

This program allows an ITP5112L keyset or OfficeServ Softphone user to use the Group conference call feature. Up to 100 stations can be allowed in the system. Each user can have up to 5 pre-programmed conferences of up to four other members plus their own station. NOTE: When a large number of stations are allowed group conference feature consider installing an SCM board to increase conference circuits from 6 to 24 maximum.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options

## MMC: 614 SET A STATION/C.O. LINE CALL GROUP

### DESCRIPTION:

This program is used to define on build “USE” groups to restrict calling. You can assign stations to a specific STATION USE GROUP and trunks to a specific TRUNK USE GROUP.

Definable USE GROUPS:

STATION USE GROUPS = 001 to 300  
TRUNK USE GROUPS = 301 to 500

Example of how to use: Initially all stations can call all other stations because they are all in Station Use Group 001. Put stations 225 to 250 in Station Use Group 002 then go to MMC 314 and restrict 001 from using or calling 002.

Now put trunks 711 to 720 in Trunk Use Group 302 then go to MMC 304 and set ANS:NO and DIAL:NO for Station Use Group 001.

You have now restricted station 201-224 (001) from using trunks 711-720 (301). Stations 201-224 (001) can not call station 225-250 (002).

Note: Station Use Groups and Trunk Use Groups must be in the same Tenant Group, either 1 or 2.

### PROGRAM KEYS

## MMC: 615

## MGI GROUP

### DESCRIPTION:

This optional program sets designated MGI ports for specific services. This allows “grading” of MGI card(s) for traffic conditions. The MGI ports can be segregated into groups. Keep in mind that any entries made here can be ineffective, if conflicting entries exist in MMC 616.

- **LOCAL ITP:** This determines what MGI ports can be used with ITP keyphones across a private IP network
- **PUB IP ITP:** This determines what MGI ports can be used with ITP keyphones on a public IP network.
- **VOIP NTWK:** This determines what MGI ports can be used for enhanced proprietary Samsung VoIP networking between OfficeServ 500 and OfficeServ 100 systems across a private IP network.
- **PUB IP NTWK:** This determines what MGI ports can be used for enhanced proprietary Samsung VoIP networking between OfficeServ 500 and OfficeServ 100 systems on a public IP network
- **VOIP TRUNK:** This determines what MGI ports can be used as industry-standard H.323 VoIP trunks for communications across a private network
- **PUB IP TRK:** This determines what MGI ports can be used as industry-standard H.323 VoIP trunks for communications on a public network
- **MGI3 NEEDED:** This determines what MGI ports can be used for T.38 facsimile communications across a private network.
- **PUB IP MGI3:** This determines what MGI ports can be used for T.38 facsimile communications on a public network.
- **ITP PAGED:** This determines which trunk members can be used for ITP internal station page.

***The MGI ports can be regarded as trunks and allow two selection modes: Sequential or Distributed.***

The members of each selection are the actual ports on the MGI card(s)

# MMC: 616

# MGI USER

## DESCRIPTION:

This optional program selects which specific MGI ports will be dedicated on a per-port basis for IP station/trunk devices. If this MMC is not utilized, allocation of MGI ports will be controlled by MMC 615. By defining dedicated MGI port usage, the IP station/trunk selected will always use the port programmed. MGI ports can be assigned private and public ITP stations (32XX), VoIP Networking trunks (83XX), H.323 trunks (84XX), SIP trunks (85XX) and MGI 3 facsimile. Only one assignment per MGI port is permitted. Any entries made here will override entries made in MMC 615.

# TOLL DENY TABLE

## DESCRIPTION:

Provides a way to make toll restriction (call barring) very easy and flexible. There are 500 entries in the deny table and each entry index can be assigned to a class of service. Each index can have up to 12 digits. With the use of wild cards (MMC 704 Assign Wild Character), more flexibility can be built into toll restriction. Wild cards can be used repeatedly in the dial string, limited only to what is allowed or denied in MMC 704. There are six toll levels, B to G, that are programmable. Toll level A is set as unrestricted by default and toll level H is set as in-house only by default.

# MMC: 703

# TOLL ALLOWANCE TABLE

## DESCRIPTION:

Provides a way to make toll restriction very easy and flexible. There are 500 entries in the allow table and each entry index can be assigned to a class of service. Each index can have up to 12 digits. With the use of wild cards (MMC 704 Assign Wild Character), more flexibility can be built into toll restriction. There are six toll levels, B to G, that are programmable. Toll level A is set as unrestricted by default, and toll level H is set as in-house only by default.

# MMC: 705 ASSIGN SYSTEM SPEED DIAL

## DESCRIPTION:

Enables the assignment of system speed dialling numbers. There are up to 500 entries available for programming ([see MMC 606](#)) if SYSTEM SPEED DIAL MAX = 500 in MMC 861 or 950 available if SYSTEM SPEED DIAL MAX = 950 in MMC 861. Each speed dial number consists of a trunk or trunk group access code followed by a separator and up to 24 digits to be dialled. These dialled digits may consist of 0-9, \* and #. If the system recognises a valid trunk or trunk group access number, it will automatically insert the separator.

## MMC: 706 SYSTEM SPEED DIAL BY NAME

### DESCRIPTION:

Allows an 11-character name to be entered for each system speed dial location. This name enables the speed dial number to be located when using the directory dial feature. The directory dial feature allows the display keyset user to select a speed dial location by scanning its name.

Names are written using the keypad. Each press of a key selects a character. Pressing a different key moves the cursor to the next position. For example, if the directory name is SAM SMITH, press the number 7 three times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing the A key changes the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

## MMC: 709 TOLL PASS CODE / SPECIAL CODE TABLE

### DESCRIPTION:

This MMC provides a means to program three trunk code tables as described below.

**PBX ACCESS CODE:** This table contains up to five entries and is used to identify the trunk access codes needed for toll restriction to be properly applied when the system is used either behind a PBX or with CENTREX-supplied dial tone. Toll restriction will only be applied on trunks flagged as PBX in MMC 401 if a trunk access code entered in this table is dialed. Toll restriction will be applied to the digits following the trunk access code.

**SPECIAL CODE:** This table identifies to the system dialling rules the special feature codes used to activate central office custom calling features such as CID Block and call waiting disable. The special feature codes can be used on a per call basis without affecting LCR or toll restriction programming. There is a maximum of ten (10) entries available each of which may be up to four digits long. The four dialing rules that apply to the Special Code Table are as follows:

- Rule 1. Toll restriction is only applied to digits following the entries in the Special Code Table. This eliminates toll restriction bypass with second dial tone central office features such as CID block (\*67).
- Rule 2. LCR will only route calls based on the digits following the entries in the Special Code Table. This rule allows end user per call special code activation.
- Rule 3. LCR modify digits tables will only delete digits following the Special Code Table entries. This allows central office features such as CID block to be used when LCR deletes digits. Can be used in Foreign Exchange (FX) routing by removing the 1+ area code..
- Rule 4. LCR modify digits tables will only insert digits after the Special Code Table entries (MMC 718). This allows for central office features such as call waiting block to be activated but route the call with a specific PIC code such as 10288 (AT&T).

Example of Rule 4: User dials \*67 1 305 529 2900, the system will seize a C.O. line and dial \*67 10288 1 305 529 2900.

## MMC: 709

**TOLL OVERRIDE:** This table of eight entries is used to identify to the system numbers that will bypass all dialing restrictions. This bypass includes Toll restriction, Trunk access and forced authorization or account codes. Each entry in the table can be up to 14 digits long.

**OVRD USE TRK GRP:** This entry designates the trunk group that override calls will access.

# LCR ROUTE TABLE

## DESCRIPTION:

The LCR ROUTE TABLE is responsible for selecting a specific trunk group in the completion of an outward bound call. This table works in conjunction with LCR DIGIT TABLE, LCR TIME TABLE, LCR COS TABLE and LCR MODIFIED DIGITS TABLE. After the user dials a valid digit string, the system uses the LCR ROUTE TABLE to select a specific predetermined trunk group. There is a maximum number of 32 routes available. If more than one trunk group is available for call completion, the system uses the first designated trunk group and then starts to utilise succeeding trunk groups. If all trunk groups are busy in a selected route, call queue becomes active and allocates trunks as they become available.

# LCR MODIFY DIGIT TABLE

## DESCRIPTION:

This program entry is also referred to as Outdial Rules. This will give the system the ability to add or delete a digit string or singular digit if needed to complete a call. A perfect example is the adding of a digit "1." An advantage is to insert a common carrier network access code of 1010288 (ATT®). With these digits inserted, a long distance call will be placed over a local line utilizing the common carrier network. The characters \* and # can also be entered. There are 200 modify digit entries available.

## MMC: 714 DID NUMBER AND NAME TRANSLATION

### DESCRIPTION:

Assigns an incoming DID call to a specific ring plan destination. It also provides a call waiting option, if needed, so that a second incoming DID call can be received. The table is also used to define which MOH source a caller to that DID number will hear when placed on hold. An 11 character name can be added to the number. There are a maximum of 999 entries. If there is no matching number on DID service the call is routed to the operator group for that ring plan.

Definitions of option are as follows:

1. **DGT:** Digits to be received from CO. Up to 16 digits may be entered.
2. **MOH SOURCE:** Allows the technician to select what the calling party will hear in regards to that DID/DNIS number if the call is placed on hold. There are a total of 6 possible music selections (see below).

In addition to "TONE" or a music source, you may also select an Auto Attendant (AA) port to provide continuous play of a specific recording. The AA port selected must be the last AA port on the AA card (e.g. 3958). If selected, the Music on Hold will be the message defined in MMC 736.

If you have a SVM Voice Mail System installed you may also select a SVM recording as a music source. The recording must already been defined in MMC 748 and will show up here as the SVM port associated with the recording.

### OPTIONS

- 2.1 **NONE:** No Music on Hold. Follows the setting in MMC 408 for the trunk the call comes in on.
- 2.2 **TONE:** A repeated tone is played to the outside party.
- 2.3 **INTERNAL CHIME "OLD FOLKS AT HOME":** This is entered as the directory number of the music source on the MCP(3701).
- 2.4 **EXTERNAL DEVICE:** Music Source or Digital announcer. This is entered as the directory number of an external music source.
- 2.5 **DIGITAL ANNOUNCEMENT ON AA CARD:** This is entered as the directory number of the last AA port of an AA card. For further details on using an AA port as an MOH source please see MMC 736.

## MMC: 714

**2.6 VOICE MAIL SOUND FILE:** If the OfficeServ 500 system has an optional SVM card installed, up to 100 custom recorded sound files from the Voice Mail card can be used for MOH sources. Select the SVM port assigned in MMC 748. For information on creating the sound files see SVM System Administrator Manual-Recording greeting by number. If you select this option be advised that each VM MOH source requires a dedicated SVM port/channel.

2. PRI = DID priority option. There are 9 priority levels: priority 1 is the highest and priority 9 is the lowest.

When calls arrive into a station group and group members are all busy the call is queued. The system will assign a priority to the DID number so that calls from a high priority DID number will be placed at the front of the group queue.

3. 1: XXX, 2: XXX, 3: XXX, 4: XXX, 5: XXX, 6:XXX = ring plan and destination during each ring plan. The destination can be a station, station group, trunk or trunk group. If trunk or trunk group is selected the trunks must be programmed as E&M trunks to allow the received digits to be re-sent on the facility(s). This is referred to as DID Repeat digits over tie line.

NOTE: An entry of the character "B" means to repeat the received digits.

4. CW: Call waiting Yes/No . Allow a second DID call to be received
5. MC: This is the maximum number of simultaneous calls to this DID the system will allow. If more call attempts are made the system will return a busy signal to the caller.
6. DELETE: The number of digits to delete. This is useful with Tandem switching, mixed numbering plans and DID Repeat digits over tie line. Maximum number of digits that can be deleted is 16.
7. NAME: Input up to 11 characters to identify call.

Names are written using the keypad. Each press of a key selects a character. Pressing the dial pad key moves the cursor to the next position. For example, if the directory name is "SAM SMITH," press "7" three times to get the letter "S." Press "2" once to get "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key changes the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

8. TONE: Ring tone options for a specific DID number (No. 1~8).
9. CAD: Ring cadence options for a specific DID number at SLT's (No. 1~5).

# MMC: 715 PROGRAMMED STATION MESSAGE

## DESCRIPTION:

Allows custom messages to be programmed or default messages to be changed.

Messages are written via the keypad. Each press of a key will select a character. Pressing a different key will move the cursor to the next position. For example, if the message is "Sunbathing," press the number "7" three times to get the letter "S." Now press the number "8" twice to get the letter "U." Continue selecting characters from the table below to complete your message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right or the DOWN key to move the cursor to the left. A space can be entered by using these keys.

## MY AREA CODE

### DESCRIPTION:

This MMC defines the home area code and country code for the OfficeServ 500 system. This information is used for caller ID, ANI and ISDN calls in defining the area code on incoming calls. This MMC removes the local area code to allow callback without digit modifications in LCR.

NOTE: If 10 digit local dialing is used My Area Code is not used. If 7 digit local dialing is used, then My Area Code is used and removes the area code. Inserting a 1 for the country will add a 1 in front of all numbers stored in the CID review log.

# IDLE DISPLAY

## DESCRIPTION:

This program allows the technician or system administrator to create 10 sixteen character messages (pieces of information) that can be viewed by users with an ITP-5112L model IP keyset. All 10 messages can be displayed simultaneously. The individual user must use MMC 120 to select idle display option as "INFORMATION". The default setting is 'CALENDAR'.

Messages are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH" press the number "7" three times to get the letter "S". Now press the number "2" once to get the letter "A". Continue selecting characters from the table below to complete message. Pressing the "A" key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

## MMC: 721 SAVE STATION KEY PROGRAMMING

### DESCRIPTION:

Provides a service tool which will minimize the accidental loss of programmable keys on the OfficeServ 500 electronic keysets. The method of operation is simple, first the data is saved and then the station can be replaced with another station type or the keys can be reprogrammed to other features. Once testing or replacement is completed, the data can be restored to the individual station, providing the same type is in place.

NOTE: This program is not to be confused with AUTO SET RELOCATE (MMC 315). This program is for saving and restoring the same electronic device type at that port.

# MMC: 722 STATION KEY PROGRAMMING

## DESCRIPTION:

Allows the customizing of programmable keys on specific electronic keysets, AOM, or 64 button module on the OfficeServ 500 system. For keysets, buttons 1 and 2 are set as CALL buttons by default. For AOM's and 64 button DSS box's all buttons are set as DS keys by default. Features are entered via dial pad keys by pressing the dial pad number the required number of steps to select the feature. For example, for OHVA, the number 6 is pressed three times. If the BOSS key is required, press 2 for the first letter B and then use the UP or DOWN key to change the selection from BARGE to BOSS.

## MMC: 723 SYSTEM KEY PROGRAMMING

### DESCRIPTION:

This MMC is much like MMC 722, Station Key Programming. The main difference is that this MMC is system-wide rather than on a per-station basis. Features are entered via the dial keypad by pressing numbers as shown in the table. For example, for OHVA the number 6 is pressed three times. If the BOSS key is required, press 2 for the first letter B, and then use the UP or DOWN key to change selection from BARGE to BOSS.

**DIAL KEYPAD**

COUNT→	1	2	3
DIAL 2	AAPLAY	BARGE	CALL

KEYPAD	Used to enter selections

## MMC: 723

SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

### ACTION

### DISPLAY

1. Press TRANSFER 723.  
Display shows.
2. Enter type of set via dial keypad ( e.g.,5)  
OR  
Press UP or DOWN key to make selection  
and press RIGHT soft key.
3. Enter key number (e.g., 18)  
OR  
Press UP or DOWN key to make selection  
and press RIGHT soft key.
4. Using table above, press dial keypad  
number to make selection  
OR  
Press UP or DOWN key to make selection  
and press RIGHT soft key to advance cursor  
to step 5 to enter extender, if required  
OR  
Press LEFT soft key to return to step 3.
5. If required, enter extender (e.g.,03)  
OR  
Press UP or DOWN key to make selection  
and press RIGHT soft key to return to step 2.
6. Press TRANSFER to store and exit  
OR  
Press SPEAKER to store and advance to  
next MMC.

**MMC: 724****DIAL NUMBERING PLAN****DESCRIPTION:**

This MMC allows the technician to change directory numbers for stations, trunks, station groups, trunk groups and feature access codes. The system can be preprogrammed with a default three or four digit numbering for station, station groups and trunk numbers depending on the position of the DIP switches on the MCP2 card. Default numbering plan is only assigned once the system is powered up for the first time OR once the system memory has been manually cleared. There is an error message provided to prevent the accidental duplication of a directory number or feature access code.

DIAL	OPTION	DESCRIPTION
00	STN NUM PLAN	This is where station directory numbers are changed or assigned
01	TRK NUM PLAN	This is where trunk directory numbers are changed or assigned
02	AA/VD NUMPLAN	This is where AA/VoiceDial port directory numbers are changed or assigned
03	MISC NUM PLAN	This is where directory numbers for relays, MOH ports, and the Internal Modem are changed or assigned
04	STNG NUMBER PLAN	This is where station group numbers are changed or assigned
05	TRKG NUMBER PLAN	This is where trunk group numbers are changed or assigned
06	FEAT NUMBER PLAN	This is where feature access codes are changed or assigned. Dialing codes are entered via the dial pad key by pressing the dial pad number, the required steps to select this feature. For example, for OHVA, the number 6 would be pressed three times. NOTE: Please remember that this program is system-wide.
07	BRI STN NUM PLAN	This is where directory numbers for BRI ports. MMC 427 is to assign as stations or trunks.

**MMC: 724**

09	NTWK LCR NUMPLAN	This is where additional LCR access codes are entered in the case where two or more systems are networked together.
10	VIRT EXT NUMPLAN	This is where virtual station directory numbers are changed or assigned.
11	MGI NUM PLAN	This is where the MGI port directory numbers are changed or assigned.
12	IP STN NUM PLAN	This is where IP-based station directory numbers are changed or assigned
14	VOIP NET NUMPLAN	This is where Samsung proprietary switch-to-switch enhanced IP networking port directory numbers are changed or assigned
15	H323 TRK NUMPLAN	This is where VOIP H.323 trunk port directory numbers are changed or assigned
17	SIP TRK NUM PLAN	This is where VOIP SIP trunk port directory numbers are changed or assigned

## SMDR OPTIONS

### DESCRIPTION:

Allows the system administrator to select the information printed on the SMDR report. The following options may be selected to print on SMDR:

- |                     |  |
|---------------------|--|
| 00. PAGE HEADER     | This option determines whether a page header will print at the top of each page. This would normally be turned off if SMDR is being sent to a Call Accounting machine. |
| 01. LINE PER PAGE   | This option selects the length of each page to determine when to print the SMDR header. The number of lines may be in the range 01–99.                                 |
| 02. INCOMING CALL   | This option determines whether incoming calls will print on SMDR.  |
| 03. OUTGOING CALL   | This option determines whether outgoing calls will print on SMDR.  |
| 04. AUTHORIZE CODE  | This option determines whether authorization codes will print on SMDR.   |
| 05. SMDR START TIME | This option determines whether valid calls will include the minimum call time in total call duration.  |
| 06. IN/OUT GROUP    | This option allows a message, IN GROUP or OUT GROUP, to be printed in the digits dialed column each time a station enters or leaves a group.                           |
| 07. DND CALL        | This option allows a message, IN DND or OUT DND, to be printed in the digits dialed column each time a station enters or leaves DND.                                   |
| 08. WAKE-UP CALL    | This option determines whether stations receiving an alarm reminder call will print on SMDR.   |
| 09. DIRECTORY NAME  | This option allows the system administrator to enter a 16 character name which will appear on the SMDR header.   |

## MMC: 725

- |                       |   |
|-----------------------|---|
| 10. CALLER ID†        | This option can be selected to print Caller ID data received from the Central Office on incoming calls. This option requires the use of a 132 column (wide carriage) printer or an 80 column printer set for condensed print. |
| 11. ABANDON CALL†     | If this option is set to YES, unanswered calls for which CID information was received will print on SMDR.   |
| 12. NO. OF DIAL MASK  | If this option is set to a numeric value, the selected last digits of the number dialed field will be masked as asterisks (*) on the SMDR print out. Maximum masked digits is 18.   |
| 13. INCOMING ANSWER   | If this option is set to YES, the duration of calls ringing before answered will print on SMDR.   |
| 14. INTERCOM CALL     | If set to YES intercom calls will print on SMDR.  |
| 15. KEY MMC IN/OUT    | If set to YES then the SMDR record will show programming being opened and closed in MMC 200 and MMC 800.  |
| 16. HOTEL CALL COST   | This option determines if the cost of the Hotel Room will be presented on the SMDR printout.  |
| 17. HOTEL PAGE FEED   | This option determines at which point, the printer will perform the page feed function.   |
| 18. HOTEL START LINE  | This option determines the point at which the system will begin counting, to determine which line to begin printing reports.  |
| 19. ITP REGISTRATION: | When set to YES, whenever an ITP set registers with the system the SMDR record will show the station number in the EXT field and the IP address and signalling port in the ACCOUNT field.                                     |
| 19. SET RELOCATION:   | When set to YES the SMDR record will print set relocation activity. One station number will print in the EXT field and the other station number will print in the ACCOUNT field.  |

**MMC: 725**

The DIRECTORY NAME that appears on the SMDR header is programmed as follows:

Names are written using the keypad. Each press of a key selects a character. Pressing the next key moves the cursor to the next position. For example, if the directory name is SAM SMITH, press the number 7 three times to get the letter S. Now press the number 2 once to get the letter A. Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key changes the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the right soft key to move the cursor to the right.

- DCS KEYSETS**

COUNT	1	2	3	4	5
DIAL 0	Q	Z	.	)	0
DIAL 1	space	?	,	!	1
DIAL 2	A	B	C	@	2

## MMC: 726

## VM/AA OPTIONS

### DESCRIPTION:

This MMC is used to define all the in band DTMF codes sent to SLT voice mail ports for an external VM system. These in band codes can be 0-9, A, B or C, and performed two functions. Note that this MMC is not used for Samsung in-skin VM systems.

#### 1. CALL AND TYPE INFORMATION

This is a DTMF signaling string sent to a voice mail port when the voice mail port answers a call. This DTMF information tells the voice mail port what type of call it is receiving and where the call is coming from. e.g. call has forwarded from extension 225

#### 2. CALL PROGRESS TONES

These are sent to the voice mail system to provide information about the progress of the call. e.g. ringback, busy or disconnect.

Most Voice Mail systems can utilize DTMF in band signaling for more efficient call processing. This MMC has many parameters that can be programmed according to the type of automated attendant and/or voice mail system connected.

### CALL and TYPE INFORMATION

The format of the DTMF data sent to a VM/AA port is as follows:

[CALL TYPE] + [DN1] + [SEPARATOR] + [DN2]

an example of this would be

[FORWARD ALL ] from [ 225 ] on trunk [ 703 ]

Each field can be programmed individually as follows:

**EXTENSION FOR DN1:** If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 500 will send data in the DN1 field indicating that a station is ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the OfficeServ 500 system will not send station data in the DN1 field.

## MMC: 726

**TRUNK FOR DN1:** If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 500 system will send data in the DN1 field indicating that a trunk is ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the OfficeServ 500 system will not send trunk data in the DN1 field.

**EXTENSION FOR DN2:** If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 500 system will send data in the DN2 field indicating the originating station of the call ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the OfficeServ 500 system will not send station data in the DN2 field.

**TRUNK FOR DN2:** If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 500 system will send data in the DN2 field indicating the originating trunk of the call ringing the VMAA port.

If set to no, when the voice mail auto attendant system answers a call the OfficeServ 500 system will not send trunk data in the DN2 field.

**SEPARATOR:** When both DN1 and DN2 are used, a digit defined here is sent between DN1 and DN2 so the VMAA system can determine where DN 1 stops and where DN 2 starts. The separator can be DTMF 0 through 9, A, B or C

**DISCONNECT:** This is the call progress digit sent to the VMAA port in place of a disconnect open. The digit defined here is sent three times.

**CALLER ID NUMBER:** If set to yes, when the voice mail auto attendant system answers a call the OfficeServ 500 will send Caller ID data as DTMF tones to the VMAA port.

**CALL TYPE ID:** This is the DTMF digit that is sent first in the in band digit string and can identify any of the following call types:

- |                 |  |
|-----------------|--|
| 0. DIRECT CALL  | A call originating directly from another station in the system.                                      |
| 1. ALL FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD ALL set. |

## MMC: 726

- |                 |  |
|-----------------|--|
| 2. BSY FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD BUSY set.      |
| 3. NOA FWD CALL | This indicates that a call was forwarded to the VM/AA port from a station with CALL FORWARD NO ANSWER set. |
| 4. RECALL       | A call is recalling the VM/AA port after being transferred and not answered.                               |
| 5. DIR TRK CALL | A C.O. call has gone directly to VM/AA (e.g., trunk 717 DIL to VM/AA).                                     |
| 6. OVERFLOW     | A call has OVERFLOWED to the VM/AA port from a station group.  |
| 7. DID CALL     | A DID call has called the VM/AA port.  |
| 8. MESSAGE CALL | A message button or message reply feature code has been used to call the VM/AA port.                       |

## PROGRESS TONES

These are the DTMF codes that is sent to the VMAA port in place of regular progress tones. For example, when a VMAA port goes off hook to originate or transfer a call, instead of hearing normal dial tone, it will hear DTMF “ BA “ . Progress tones can greatly increase the efficiency of a VMAA system because it is easier and quicker to detect DTMF than a busy, ringback or DND tone.

Progress tones can identify any of the following.

<u>TONES</u>	<u>VALUE</u>
0. DIAL TONE	BA
1. BUSY TONE	4
2. RINGBACK TONE	5
3. DND NO MORE	6
4. HDSET ANSWER	3
5. SPKER ANSWER	2

## MMC: 726

### GENERAL RULES

1. 201 is talking to a trunk and presses TRANSFER plus the station number, but the station is forwarded to VM/AA and VM/AA answers. When this happens, if 201 presses TRANSFER again to return to the trunk, the VM/AA port is not on hold. It is disconnected.
2. A VM/AA port leaves a message indication for a station. When the station returns the message, any available port in the VM/AA group should ring, not only the one that left the message.
3. A VM/AA port leaves a message for a station. When the station returns the message, the MESSAGE LED is not automatically turned off. If a VM/AA system turns on the MESSAGE LED, the VM/AA system must turn it off.
4. If DTMF call progress tones are not enabled, the system sends regular call progress tones (see Item # 3).
5. When a VM/AA port calls a station that is in the AUTO ANSWER or VOICE ANNOUNCE mode, the keyset will be forced to ring.
6. All calls to a VM/AA port or group ring with C.O. line ringing cadence, not intercom ring cadence.

### EXAMPLES OF VM/AA OPERATION (IN BAND DTMF DIGIT STRING)

In the following example, all call and type data is turned on unless otherwise stated. x is the separator digit, all-default values are used in these examples and [ ] is not used.

A DIL 701 calls a VM/AA port or group:

[ \* ]+[701]+[ ]+[ ]

In the above example, if C.O. information is not used:

[ ]+[ ]+[ ]+[ ] (Nothing is used)

DIL 701 calls a call-forwarded station (205):

[ # ]+[205]+[ X ]+[701]

In the above example, if forward information is not used:

[ ]+[205] +[ X ]+[701]

In the above example, if forward and DN2/C.O. information is not used:

## MMC: 726

[ ]+[205]+[ ]+[ ]

DIL 701 calls group 501 that overflows to VM/AA:

[ # ]+[501]+[x]+[701]

In the above example, if overflow information is turned off:

[ ]+[ ]+[ ]+[ ] (Nothing is sent)

A DID call rings the VM/AA directly:

[ B ]+[9999]+[ ]+[ ]

9999 are the DID digits from C.O.

In the above example, if did information is turned off:

[ ]+[9999]+[ ]+[ ]

A station transfers (blind or screened) a call (C.O., DID or intercom) to VM/AA group or port. When the transferring station hangs up (blind transfer):

[ ]+[ ]+[ ]+[ ] (Nothing is sent)

A station (202) transfers a C.O. call (702) to a station (225) that is Call Forward All to a VM/AA group or port. When the transferring station hangs up (blind transfer) and the VM/AA group or port answers:

[ # ]+[225]+[x]+[702]

A station (202) transfers a C.O. call (702) to a group (501) that overflows to a VM/AA group or port:

[ # ]+[501]+[ X ]+[702]

In the above example, if overflow information is turned off:

[ ]+[ ]+[ ]+[ ] (Nothing is sent)

A station (205) calls a VM/AA port or group :

[ \* ]+[205]+[ ]+[ ]

In the above example, if direct information is turned off:

[ ]+[ ]+[ ]+[ ] (Nothing is sent)

A station (205) calls using MESSAGE key:

[ \* ]+[205]+[ ]+[ ]

In the above example, if message information is turned off:

[ ]+[ ]+[ ]+[ ] (Nothing is sent)

A call (702) recalls back from station 225 to the VM/AA group:

## MMC: 726

[ # ]+[225]+[x]+[702]

In the above example, if recall and DN2/CO information are turned off:

[ ]+[ ]+[ ]+[ ] (Nothing is sent)

# MMC: 728 CID / ANI TRANSLATION TABLE

## DESCRIPTION:

Allows the system administrator or technician to associate a CID or ANI number received from the central office with a name programmed in this translation table. If there is no match between a received number and a name in this table, "no CID name" will be displayed.

The translation table consists of 1000 entries for an OfficeServ 500-M system and 2000 for an OfficeServ 500-L system. Each entry is comprised of a ten-digit (14 digits allowed) telephone number and a 16-digit name.

Names are written using the keypad. Each press of a key will select a character. Pressing the next key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the VOL UP key to move the cursor to the right.

## MMC: 729 RATE CALCULATION TABLE

### DESCRIPTION:

The RATE CALCULATION TABLE is used to define the billing charges for each COST RATE. These rate tables correlate with the Trunk Cost Rate and the Costing Dial Plan. There are eight call costing rates. Each rate has the following data fields.

**FIRST INTERVAL DURATION:** This is the amount of time at the beginning of each call to which a fixed cost is applied. The range is from 0 to 999 seconds, for example, 180 seconds (three minutes).

**FIRST INTERVAL COST:** This is the dollar cost for the first interval duration. The range is from 0 to 999, for example, 345 (\$3.45).

**SECOND INTERVAL DURATION:** This is the amount of time for the duration of each billing increment after the first interval has expired. The range is from 0 to 999 seconds, for example, 006 seconds (six seconds).

**SECOND INTERVAL COST:** This is the dollar cost for each billing increment. The range is from 0 to 999, for example 100 (\$1.00).

**SURCHARGE:** This is a one-time charge that is applied to the call over and above the time charges. The range is from 0 to 999, for example 150 (\$1.50).

## MMC: 730

## COSTING DIAL PLAN

### DESCRIPTION:

The COSTING DIAL PLAN is used to analyze the leading dialed digits of a dialed number and determine what DIAL PLAN it is to follow. Data entry for this program is in three fields: ENTRY, DIGITS and COST RATE table reference.

DIGITS: Up to 500 entries may be made. Each entry can be up to ten digits. These are the entries that will be searched to find a match with the digits dialed by the station making the call. This is a leading digits table and the system will look for the exact leading digits in the table that match the number dialed. For example, if a user dials 1305 and the COSTING DIAL PLAN contains 1, 1308 and 1312, the dialed digits will be matched to 1 because 1308 and 1312 do not form a complete match. When this table is created by the technician or when any new entries are added, the system automatically places all entries in numerical order.

Wild cards (\*) can be used to represent any digit. The Toll Restriction Wild Character assignment (MMC 704) is common with Call Costing and Toll Restriction. When all entries are used, [LAST ENTRY] is displayed.

### DIAL PLAN

This shows in the programming display as DP and represents a pattern (1–7, 8). This pattern is used by MMC 422 TRUNK COST RATE, to determine the correct billing according to MMC 729 RATE CALCULATION TABLE

When the system finds a DIAL PLAN match for the digits dialed, the system checks MMC 729 to see what RATE CALCULATION to use for costing the call.

### EXAMPLES

When a station user dials a number, the system will search the COSTING DIAL PLAN to find a match. If 13056 is dialed and this MMC contains entries 1, 13, 1305 and 1401, 1305 is the closest match and this entry will be selected. If 1305 is dialed and this MMC contains entries 1, 13, 13056 and 1401, no action will be taken until the station user dials another digit. If the next digit is 6, the 13056 entry is the closest match and this entry will be selected, but if the next digit is anything other than 6, the 13 entry is the closest match.

Whenever a new entry is added, the system will sort all entries in numerical order because this is the logical order in which the system analyzes digits. Wild cards are

## MMC: 730

checked after exact digits. If 1813 and 18\*\* are entered, the system will check 1813 first. If no match is found, it will check 18\*\*.

## MMC: 732

## AA TRANSLATION TABLE

### DESCRIPTION:

AA translation tables are responsible for routing calls based on digits dialed. There are 12 translation tables available. Each table can be assigned to one or more plans in MMC 733 Auto Attendant Plan Programming. A translation table consists of a number of entries. Each entry number has two fields to program: the first field is for the digits received by the caller and the second field is for the destination or action.

Translation tables 1-12 have 100 entries each. The destination field can be a station number, station group or another plan. Plans are entered by pressing special key A plus two digits 01– 12. If a voice mail group is entered, the call will be transferred to the voice mail system with the appropriate in band digit packet to indicate a Forward All call from the station number dialed by the caller.

The digits defined in the first field of this MMC [dialed digits] must be a valid station number.

If the digits programmed as a destination are a voice mail port the voice mail port will receive an in band packet of DTMF equal to [FWD from EXTENSION NUMBER DIALED].

There are a number of special characters that are used in translation tables. They are as follows:

- \* = Used to represent any digit.
- P = (Special Key A) Plan. Used to assign a plan as a destination (P01–P12).
- B = (Special Key B) Buffer. When used in the destination field, transfers the call to the same extension as the digits dialed by the caller.
- C = (Special Key C) Change greeting or Ring Plan.
- D = Direct to Voice Mail.

### DESTINATION :

Consider the following entry examples.

DIGITS	DEST	COMMENTS
0	0	Caller will be transferred to 0.

**MMC: 732**

<b>DIGITS</b>	<b>DEST</b>	<b>COMMENTS</b>
2**	B	If a caller dials any three digit extension number beginning with 2, the call will be transferred to the extension number dialed.
48#2	C	If a caller dials 48#2, the current plan's greeting may be changed. 48#2 is essentially a special passcode for changing the current greeting or ring plan.
1	526	If a caller dials 1, the call will be transferred to group 526.
5	P08	If a caller dials 5, the call will be transferred to plan 08.

NOTE: Number conflicts like 2 and 23 or 56 and 567 are not allowed in translation table programming.

The following applies to the OfficeServ 500 system:

Entries in the translation table will also provide the following features which are useful if a mailbox owner does not have a telephone on the system, but does have a SVM voice mailbox.

If a caller dials # + nnn he will leave a message directly in the mailbox specified in the destination.

If a caller dials \* + nnn he will log into the mailbox specified in the destination.

If the translation table contains an entry like nnn = D callers dialing nnn will leave a message directly in the mailbox specified in the destination.

**NOTES ABOUT CHANGING RING PLANS AND ALTERNATE GREETING:****MANUAL SERVICE**

1. When the OfficeServ 500 phone system changes ring plans, the AA greetings will also change as programmed in MMC 733.
2. When the AA alternate greeting passcode is entered the caller may input a digit to change the ring plan. This means that a customer who wants to put the system in a different ring plan can call in remotely and do it.
3. When the alternate greeting passcode is entered, the system will allow to select a ring plan. If a RP (ring plan) key is programmed on the OfficeServ 500 it will FLASH. The normal status of this light in a ring plan is on steady. A flashing RP key corresponding to the ring plan indicates the remote ring plan has been set. If a RTO key is available it will also flash.

## MMC: 732

4. If the alternate greeting is not activated but the ring plan is changed the OfficeServ 500 system will remain in the selected ring plan until the next scheduled ring plan change. If the alternate greeting is activated the OfficeServ 500 system will remain in the existing ring plan or the selected ring plan until the alternate greeting is manually deactivated.
5. To implement ring plan changes and /or the alternate greeting the caller must enter the number or "passcode" that implements the special key program. After the passcode is entered the caller must enter 2 digits. The first digit selects the desired ring plan to change to (1-6) or 0 for no change. The second digit activates the alternate message. 0 for no alternate message or 1 for alternate message.

Example: Caller dials into the OfficeServ 500 and is answered by the AA card. The caller then input the special code or "password" 48#2. The caller then dials 3 to select ring plan 3 and then dials 1 to turn on the alternate greeting. The OfficeServ 500 system now ring according to ring plan 3. Ring plan 3 is directed to the AA card and the caller is now answered by the alternate greeting.

## AA PLAN TABLE

### DESCRIPTION:

Used to program each AA plan. A plan is a module that processes a call. There are twelve plans available in each AA card. Each plan can route a caller to any group, extension or another plan. Each port can answer calls with a different plan as defined in MMC 735.

This MMC includes options to select messages to play to a caller. These messages can be as follows:

#### MESSAGES 01–48

These can be created using the AAREC soft key (programmed on keysets by using MMC 722 or 723). A total of two minutes of message time is available.

#### MESSAGES 49–64

These are pre-programmed as follows:

- 49 "Thank you for calling, please dial your party's extension number."
- 50 "Invalid number, please try again."
- 51 "I'm sorry, there is no answer."
- 52 "I'm sorry, that station is busy."
- 53 "One moment please."
- 54 "Transferring."
- 55 "I'll transfer you."
- 56 "Good-bye."
- 57 "Thank you."
- 58 "Please hold for the operator."
- 59 "Please hold for assistance."
- 60 "Thank you, good-bye."
- 61 "I'm sorry, all stations are presently busy."
- 62 "I'm sorry, all stations are still busy."
- 63 "Please call back later."
- 64 "I'm sorry, not a valid selection."

## MMC: 733

### PLAN MESSAGE (RING PLANS 01-06)

This is the message that will be heard by the caller when the AA port answers a call if the telephone system is in a particular ring mode or if another message has been selected by the AA administrator. This message has a default selection of AA ROM message number 49 but it can be replaced with a customized message (01–48) or with any other ROM message (49–64). [For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.](#)

### ALTERNATE MESSAGE

This is the message that will be heard by the caller when the AA port answers a call if this message has been selected by the AA administrator. This message has a default selection of 49 but it can be replaced with a customized message (01–48) or with any other ROM message (49–64). [For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.](#)

### INVALID MESSAGE

Determines what message will play if the caller dials invalid digits repeatedly until the retry counter expires. Invalid digits are digits not contained in the translation table for this plan. The invalid message will repeat for the value contained in the retry counter. This message has a default selection of ROM message 64 but it can be replaced with a customised message (01–48) or with any other ROM message (49–64). [For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.](#)

### NO ANSWER MESSAGE

Determines what message will play if the caller is recalled to the AA port because of a no answer. This message has a default selection of ROM message number 51 but it can be replaced with a customized message (01–48) or with any other ROM message (49–64). [For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.](#)

### TRANSFER MESSAGE

Determines what message will play if the caller is transferred. This message has a default selection of ROM message number 53 but it can be replaced with a customized message (01–48) or with any other ROM message (49–64). [For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.](#)

### BUSY MESSAGE

Determines what message will play if the caller selects a busy station. This message has a default selection of ROM message number 52 but it can be replaced with a customized message (01–48) or with any other ROM message (49–64). [For](#)

## MMC: 733

[instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.](#)

### **NO STATION MESSAGE**

Determines what message will play if the caller dials an invalid extension (not installed). This message has a default selection of ROM message number 50 but it can be replaced with a customized message (01–48) or with any other ROM message (49–64). This retry message will repeat for the value contained in the retry counter. See Retry Count. [For instructions on how to create these recordings see Special Applications, Auto Attendant/Uniform Call Distribution.](#)

### **NO ACTION MESSAGE**

Determines what message will play if the caller does not act. This message has a default selection of ROM message number 59 but it can be replaced with a customized message (01–48) or with any other ROM message (49–64).

### **CAMP-ON**

Determines if calls will be transferred to busy stations. Calls transferred to busy stations will be camped-on. The default value is OFF.

### **ANSWER DELAY**

Sets how many rings will occur before this plan answers a call. The default value is 01 second.

### **RETRY COUNT**

Determines how many selection errors a caller may make before being transferred to the invalid digits destination. The default value is 3.

### **TRANSLATION TABLE**

Determines what translation table this plan will use ([see MMC 732 Auto Attendant Trans Table](#)). The default translation table is 01.

### **BUSY DESTINATION**

Determines the destination for the call if the selected destination is busy. This can be another station, station group or plan. Plans are entered by pressing special key A plus two digits 01–12. The default value is 500.

### **NO ANSWER DESTINATION**

Determines the destination for the call if the selected destination does not answer. This can be another station, station group or plan. Plans are entered by pressing special key A plus two digits 01–12. The default value is 500.

## MMC: 733

### NO ACTION DESTINATION

Determines the destination for the call if the caller makes no response (this is also the destination for rotary dial callers). This can be another station, station group or plan. Plans are entered by pressing key special key A plus two digits 01–12. The default value is 500.

### INVALID DESTINATION

Determines the destination for the call if the caller dials invalid digits after the retry counter has expired. This destination can be another station (within a network), station group (within a network) or plan. Plans are entered by pressing special key A plus two digits 01–12. The default value is 500.

### NOTE ABOUT TRUNK SIGNALLING

UCD is designed to hold a call until an agent is available. It is therefore essential that a customer gets a disconnect from the C.O. when a caller hangs up. If not the call may be held in the UCD loop until answered. This could be a long time, and when an agent finally does answer there would be no one there.

It is common for T1 to be configured without disconnect signal on loop start circuits. Therefore to insure that your customer will not have trunks lock up (kept busy by the AA card) after callers hang up, the dealer should order ground start circuits on T1 or have the provider engineer the circuits to send loop disconnect on loop start circuits.

It is also common for analogue circuits to be Multiplexed on a carrier like a SLC 96 (Subscriber Loop Carrier, 96 channels - Pronounced SLICK 96) These may also lack a positive disconnect. Note that it may not be immediately apparent if an analogue line is delivered over a SLC, as they will look like regular copper tip and rings at the demark. When in doubt verify the disconnect with a meter.

# MMC: 734 AUTO ATTENDANT MESSAGE MATCH

## DESCRIPTION:

It is possible to make 48 customized recordings on the AA ports of the AA card. For instructions on how to create these recordings, [see User Instructions, Auto Attendant and Uniform Call Distribution System Administration](#).

It is important to understand the difference between recordings and messages. For example, you have customized recording 01 as “Thank you for calling” and you have customized recording #02 as “One moment please.” By default, message 01 is recording 01. When message 01 is selected as part of AA or UCD programming, the caller hears “thank you for calling” (recording 01). When message 02 is selected, the caller hears “one moment please” (recording 02). If you need a new message that says “thank you for calling, one moment please,” you can record this as recording 03 and play it as message 03 but this uses some of the RAM storage on the AA card. An easier way is to link recordings 01 and 02 to produce message 03.

This is the purpose of this MMC. We simply tell the system that message 03 equals recording 01 plus recording 02. In this MMC, the top line of the keyset display indicates a message number and the bottom line indicates the recording numbers.

# AA USE TABLE

## DESCRIPTION:

Determines what plan will answer each call. Each AA is assigned a specific plan and each AA group assigned in MMC 601 is assigned a specific plan. When a call is received by an AA port, the appropriate plan will answer the call depending on the port or group that was called.

NOTE: You are not programming what port answers, but what port is called.

The following example shows how flexible this system is:

AA PORT OR GROUP	AA PLAN TO ANSWER
3951	PLAN 01
3952	PLAN 02
3953	PLAN 03
AA GROUP 510 ( 3951, 3952, 3953)	PLAN 04
AA GROUP 511 ( 3951, 3952)	PLAN 05
AA GROUP 512 ( 3953, 3954)	PLAN 06

## PROGRAM KEYS

UP & DOWN	Used to scroll through options

## ASSIGN AA MOH

### DESCRIPTION:

Used to define what message 01–48 plays as a Music on Hold (MOH) source if selected in MMC 309 or 409. This message will repeat continuously. Only the last AA port on an AA card can be used as a MOH source. This MMC assigns a message number to the last port of each card. This MMC must be programmed before AA/MOH data can be assigned in [MMCs 309, 408 and 607](#).

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC
HOLD	Used to clear previous entry

### ACTION

1. Press TRANSFER 736.  
Display shows.
2. Press UP to select AA port.
3. Press RIGHT soft key and enter MSG number.
4. Press TRANSFER to store and exit  
OR  
Press SPEAKER to store and advance to next MMC.

## MMC: 737

## AA PLAY GAIN

### DESCRIPTION:

Because the volume level of C.O. lines can vary according to the central office and the subscribers distance from it. This MMC will adjust the AA cards playback volume.

The value of the pre recorded messages and the user customized messages may be adjusted individually for each port. The Values are from 1 to 4 with 4 being the loudest.

Before changing this verify that your C.O. lines are within specification.

### PROGRAM KEYS

## MMC: 740

## VM CARD RESTART

### DESCRIPTION:

This MMC is only used for the Samsung Plug In Voice Mail Card.

There are two options available in this MMC:

#### DOWNLOAD

When the SVM card starts, part of the power up procedure will download data from the OfficeServ to determine time, date, what mailboxes to create, and system numbering plan. This must be done at least once, but once done this download feature can be turned OFF to save boot up time.

#### CARD RESTART

If this option is set to YES the SVM card will immediately restart according to the download OPTION specified above.

#### VIRTUAL NUM DOWN

When the SVM card restarts, if this option is set to YES for any of the categories under this heading, it will create the additional mailboxes. This must be done at least once, but once done this download feature can be turned OFF to save boot up time. The categories are:

TYPE	DESCRIPTION
VIRTUAL EXT	Virtual extension numbers.
DESKTOP ITP	DESKTOP IP-based phone number
MOBILE ITP	Wireless IP-based mobile phone number
BRI STATION	ISDN terminal numbers
VoIP NET TRK	VoIP networking trunk numbers
VoIP 323 TRK	VoIP H.323 trunk numbers
VoIP SIP TRK	VoIP SIP trunk numbers
REMOTE STN	Stations in remote nodes when networking. (Used for Centralized Voice Mail Applications)

#### NOTE:

*If during any test procedures you need to run the OfficeServ 500 system with a default database and power up with this MMC option set to YES the SVM database will be overwritten according to the data in MMC 741 and the default numbering*

## MMC: 740

*plan. If you plan this type of test, remove SVM until the procedure is finished and the customer database is reloaded.*

### PROGRAM KEYS

## MMC: 741

## ASSIGN MAILBOX

### DESCRIPTION:

This MMC is only used for the Samsung Plug in Voice Mail Card (SVMi). It assigns each station or group as having a mailbox (yes or no). When stations or groups are flagged as YES, during Voice Mail card power up mailboxes will be created for each directory number with a "YES" entry.

Once the Voice Mail database has been created new boxes can be added.

- a) Through Voice Mail administration,
- b) By adding a new mailbox in this system and cycling system power.

If a mailbox is to be removed it must be done through Voice Mail administration.

If a station that does not have an associated voice mailbox, calls the Voice Mail system they will be answered by the Voice Mail system main greeting.

NOTE: Groups 529/5029 in the M and 549/5049 in the L cannot be assigned mailboxes as these are the VM groups. Mailboxes that are needed for people that do not have an extension must be added through Voice Mail programming.

### PROGRAM KEYS

## MMC: 743

## AUTO RECORD

### DESCRIPTION:

This MMC is only used for the Samsung Plug in Voice Mail Card (SVMi).

Some specific stations in the phone system can be assigned to automatically record conversations. When this option is set, all incoming, all outgoing, or all calls (incoming or outgoing) can be recorded.

When this option is selected a specific port should be assigned for each station set to automatic conversation recording or the effectiveness of this feature cannot be guaranteed.

In this MMC you can assign:

1. Which stations use this feature. – Station number
2. What mailbox the conversation is recorded in. – Mailbox number
3. What type of conversations are recorded, in, out or both. – I, O or B
4. What port is dedicated to the station. – Voice mail port number

The maximum number of stations assigned the AUTO RECORD feature is limited to the maximum number of SVMi ports. Each station using AUTO RECORD depletes Voice Mail/Auto Attendant ports by one.

The same port cannot be assigned to more than one station. Attempts to do this will result in an error message.

When a Voice Mail port is assigned here, it is automatically removed from the Voice Mail group (529 or 549) defined in MMC 601.

**WARNING:** Before using this feature make sure that you are not violating any state or federal laws. Some states require that the recorded party be notified. SAMSUNG is not responsible for any illegal use of this feature.

## VM DAY / NIGHT

### DESCRIPTION:

This MMC is only used for the Samsung Plug In Voice Mail Card (SVMi).

SVM can operate in either a DAY or NIGHT operating mode. This mode will determine what main menu greetings and options are played to the callers.

This operating mode can change automatically (if enabled in SVM) according to the setting in this MMC.

This MMC contains either a DAY or NIGHT instruction for each OfficeServ 500 Ring Plan.

## WARNING DESTINATION

### DESCRIPTION:

This MMC is used to set alarm notification destinations for the Samsung Plug In Voice Mail card and for the Hotel/Motel transaction buffer alarm.

#### 1. Samsung Plug-In Voice Mail Card (SVMi)

This MMC provides an emergency destination for calls destined for the Voice Mail card, if the Voice Mail card is removed or is offline. In addition any calls that are forwarded to the Voice Mail card will not forward, they will remain ringing at the “fwd from” station until answered. This destination can be a station number or a group number.

#### 2. Hotel/Motel Transaction Record Buffer Alarm

This MMC provides a destination for the Transaction Report Buffer Alarm. The transaction record buffer has a maximum capacity of 10,000 records. This alarm will ring the destination when the buffer level has reached 9500 records. Note: Either of these alarms may be disabled by setting the destination as NONE.

## VM ALARM

### DESCRIPTION:

This MMC is only used for the Samsung Plug in Voice Mail Card (SVMi).

This MMC will generate an alarm message in the mailbox defined in MMC 745 whenever the Voice Mail disk drive reaches this threshold.

The threshold is measured in % full. This means that if the MMC is set for 80, the alarm will be generated when the disk exceeds 80% of the available drive space. The end user should be instructed to delete old messages to recover disk space.

## ASSIGN VM MOH

### DESCRIPTION:

This MMC is only used for the Samsung Plug in Voice Mail Card (SVMi).

This MMC is used to assign each port a Music on Hold source for the OfficeServ 500 from a sound file located on the SVM hard disk drive. The 100 available sound files are defined as numbers 5000 to 5099.

Basically SVM card supports various music for numbers 5000 to 5099. If you want to use default SVM support music, select the number. Otherwise, make sure you record the sound file first. The next step is to assign the sound file to a SVM port. For example, if you record sound file 5025 you would associate 25 with a specific SVM port, e.g. 225. This will dedicate the port for use only as MOH and remove it from group 529 or 549. Now 225 will show up as a valid music source in MMC 308, 309 and 408.

Each Music on Hold source assigned here requires one SVM port. SVM port is used for VMMOH, it must be disabled before boot up since SVM and the phone system use port 1 during boot up to exchange critical information. For this reason we suggest you use the last port as VMMOH ports.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options

## MMC: 759

## CLI RINGING

### DESCRIPTION:

This MMC is for Central Office lines using Caller ID services. It uses a table of 500 entries containing telephone numbers that are to be acted upon in one or more of the following ways:

1. **REJECT OPTION:** Matches the Caller ID number received on the incoming call to an entry in this table and assigns it to be rejected. The phone system will hang up on this call before it is answered. NOT FOR USE IN THE USA.
2. **PRIORITY QUEUEING:** Matches the Caller ID number received on this incoming call to an entry in this table assigns it a priority of 1~9 when it rings any station group. When the group is busy a PRI-1 will be placed ahead of the other caller waiting to be answered.
3. **DISTINCTIVE RINGING:** Matches the Caller ID number received on the incoming call to an entry in this table and assigns it to ring with a specific TONE for keysets or CADENCE for SLTs.

The CID Ringing table consists of 500 entries.

**CLI:** CID number to be received from the central office. Up to 16 digits may be entered.

**REJ:** CID call reject option. When this is set to YES, an incoming call with a CID number that matches the CLI field will be rejected (hang up) by the system. (NOT FOR USE IN USA).

**PRI:** CID priority option. There are 9 priority levels: priority 1 is the highest and priority 9 is the lowest. When calls into station group come in and group members are all busy, the system will assign a priority to the CID number so that calls from a high priority CID number will be placed at the front of the group queue. If this option is set to NO, the longest call that is placed at the group queue has the highest priority.

**R1:XXX, R2:XXX, R3:XXX, R4:XXX, R5:XXX, R6:XXX**

Ring plan and destination during each ring plan. The destination can be a station or a station group.

## MMC: 759

**TONE:** Ring Tone options for a specific CID Number (NO, 1~98)

### TONE OPTION

NO	Calls will ring with the phone users choice of ring frequency.
1~8	Calls from the programmed CID number will ring phones with this ring frequency

**CAD:** Ring Cadence options for a specific CID Number at SLT's (NO, 1~5)

### CADENCE OPTION

NO	Calls will ring with the normal SLT's ring cadences.
1	Calls from the programmed CID number will ring SLT's with the intercom ring cadence.
2	Calls from the programmed CID number will ring SLT's with the CO ring cadence.
3	Calls from the programmed CID number will ring SLT's with the DOOR ring cadence.
4	Calls from the programmed CID number will ring SLT's with the ALARM ring cadence.
5	Calls from the programmed CID number will ring SLT's with the CALLBACK ring cadence.

**MMC: 760****ITEM COST TABLE****DESCRIPTION:**

*This is a Hotel / Motel software specific MMC.*

This MMC provides a means to assign a code to a billable item along with a 10 character name for the item. There are a maximum of 100 entries (00 to 99) in the table with item 00 reserved as the code for room deposits, 01 reserved as the code for phone deposits and items 89 to 99 are reserved for other system related items. These item codes with the exception of codes 93 to 99 will appear on the guest's bill at checkout and will serve to identify what each charge on the bill is for. The room bill, when printed will also show telephone calls with an item designation of TEL and the description field will show the number dialed. In addition to the name, up to 8 of the tax codes or rates defined in MMC 761 can be applied to each item.

**PRE DEFINED CODES**

ITEM	DESCRIPTION	USE
00	RM Deposit	This is the code used for pre pay room deposits
01	PH Deposit	This is the code used for pre pay phone deposits
89	W/UP SET	A wake up call has been set.
90	W/UP ANS	A wake up call was answered
91	W/UP N/ANS	A wake up call was not answered
92	W/UP CANCL	A wake up call was canceled
93	Check In	A guest has checked into a room
94	Check out	A guest has checked out of a room
95	Available	A room has been flagged as OCCUPIED
96	Occupied	A room has been flagged as AVAILABLE
97	Clean Room	A room has been flagged as NEEDS CLEANING
98	Fix Room	A room has been flagged as NEED MAINTENANCE
99	Hold	A room has been flagged as HOLD

Names for the items are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key will change the letter from upper case to lower case.

**NOTE:** When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

## MMC: 761

## TAX RATE SETUP

### DESCRIPTION:

*This is a Hotel / Motel software specific MMC.*

This MMC allows the technician to set up the 8 tax rates used in MMC 760. Each tax rate may be defined as a fixed dollar value or as a percentage of the item cost. In addition a 10 character name may be used to define the reason for the tax. The various options are further detailed below.

TAX RATE	This is the number assigned to this tax rate. The tax rates are numbered 1 to 8 to match the rate field in MMC 760 counting from left to right.
TYPE	This is the type of tax and defines if the VALUE is applied as a percentage (%) of the cost of an item or is added as a fixed dollar value (C) to an item, or included (I) in the room charge.
VALUE	This is the actual tax rate that will be applied to the item cost.
NAME	This is a 10 character name that will be displayed on the room bill alongside the tax.

Names are written using the keypad. Each press of a key will select a character. Pressing the dial pad key will move the cursor to the next position. For example, if the directory name is "SAM SMITH," press the number "7" three times to get the letter "S." Now press the number "2" once to get the letter "A." Continue selecting characters from the table below to complete your message. Pressing the bottom left programmable key will change the letter from upper case to lower case.

NOTE: When the character you want appears on the same dial pad key as the previous character, press the UP key to move the cursor to the right.

## ROOM COST RATE

### DESCRIPTION:

This MMC provides an option to charge different percentages of the full room price, on a day-by-day basis.

In other words, a room that is normally \$100.00 during peak periods or weekends, can be set to bill out at a percentage of the full \$100.00. (Setting option to 75% would yield a room charge of \$75.00).

Likewise this option can be set above 100% of the programmed room cost. (Setting option to 125% of \$100.00 room charge, would yield a room charge of \$125.00).

### PROGRAM KEYS

## LEVEL & GAIN

### DESCRIPTION:

Allows the system administrator to set the base level of the TX volume on keysets system wide. There are eight (8) levels those are able to be controled by the VOL UP and DOWN key on keyset. And maximum controllable levels in the system are ten (10). Keyset station users can vary eight levels. So this MMC gives the most flexibility to the system administrator so he can classify any desired eight(8) levels within eleven (11).

NOTE: This MMC should not be changed from the default levels without the assistance of the STA technical support department

# MMC: 806

# CARD PRE-INSTALL

## DESCRIPTION:

Allows the preprogramming of a card slot for a specific board type. A board inserted into a OfficeServ 500 system will not be recognized by the system until it is ENABLED using this MMC. Cards installed using MMC 806 will NOT be assigned in the system numbering plan. You must then use MMC 724 to assign the desired directory numbers to extensions, trunks, AA, ports or miscellaneous functions. This MMC also shows which PSU is powering the card selected.

NOTE1: If a card is removed and a different type card is inserted and this MMC is performed, the memory associated with that card (i.e. key programming, etc.) will be erased.

NOTE 2: If a second PSU is required and is not available to support the added card(s) this MMC will provide an error NO POWER and will not allow card install. A second PSU must be installed in the cabinet the card is to be installed in.

## RESET SYSTEM

### DESCRIPTION:

Provides three methods of restarting the system. The first method restarts the system and clears all memory. The second method restarts the system only. The third method restarts the system but does not reload the software from the Smart Media card. If clear all memory is selected, only the default data will return. Extreme care should be taken when using this MMC. If the system is restarted, all voice/data connections are dropped. If memory is cleared, all customer data is deleted and the system returns to defaulted status.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right

### ACTION

1. Press TRANSFER 811.

# SET COUNTRY

## DESCRIPTION:

This program allows the user to change the country version of the system software.

Programming is possible without setting ENABLE in Program 800 Set Technician Program Mode. In this case, the user must enter the technician program passcode.

Note: System restarts when the current country version is changed, and all data is initialized according to the new country version.

Caution: Version is designed to conform to the country's standards. Therefore, contact your Customer Support Center for specialized assistance when using "Program 812 Change Program Country Version."

## PROGRAM KEYS

## MMC: 815 CUSTOMER DATABASE COPY

### DESCRIPTION:

Provides a means to copy the customer database to the SMDB (OfficeServ 500 Smart Media card Data Base). This enables the on board database (SRAM) to be copied to the SMDB and also allows the SMDB database to be copied to the on board database. A daily save can be programmed to automatically save the on board data base to the SMDB. This ensures that an up to date database is always available in the case of a catastrophic failure. A daily save time of 00:00 means there is no save performed. It is recommended to CLEAR the SMDB before the SRAM is copied to it. When the SRAM is copied to the SMDB there is no interruption in service. If the SMDB is copied to the SRAM the system will reset to accept the new data.

### DATABASE IDENTIFICATION

SMDB	OfficeServ 500 Smart Media card database
SRAM	OfficeServ 500 MCP On-Board database
S:mm/dd/yy hh:mm	Indicates the time the database was saved to the SMDB or the time the SRAM was last saved
DAILY SAVE hh:mm	The time the SRAM will be saved to the SMDB

## CONFERENCE GAIN

### DESCRIPTION:

Provides a tool to adjust the gain or loss of stations and trunks in the conference bridge. This is made available to allow for the adjustment of the conference bridge due to permanent unsatisfactory C.O. conditions that may inhibit a satisfactory conference bridge. Programming adjustments can be made on individual conference analog trunk members.

**Caution!!** This MMC is not to correct low volume. To be used with the support of STA Technical Support Department.

### IDENTIFICATION

MEMBER: This identifies which size of conference the adjustment will be made for. ie. 3,4 or 5 party conference.  
A-TRK: This identifies which analog trunk member that is being addressed.  
CNF: This is the gain or loss adjustment in the conference bridge.  
SW: This is the gain or loss adjustment in the time division switch.

### PROGRAM KEYS

# MMC: 819 SMART MEDIA FILE CONTROL

## DESCRIPTION:

This program displays the name and size of the files saved on the SmartMedia card. Use this to verify files and their size. Files that are no longer necessary can be deleted to make space for new files.

STARTUP.INI	When the user selects the MCP2 or SCP2 program in MMC 818, the program information is saved in this file. This file is created only when the program is selected.
STARTUP.PRE	This program loads the MPP program saved in SmartMedia using the memory in the MCP2 board when the system is initiated. This program is essential since it is required for starting the system. .
MPPLVXXX.PGM	Program for the MCP2 board. SmartMedia shall have one or more MCP2 program since there are no MCP2 programs in the MCP2 board. The name of the program for OS 500-M is MPPMxxxx.PGM and MPPLxxxx.PGM for OS 500-L. SmartMedia shall have the MCP2 program corresponding to the type of the system (OS 500-L or OS 500-M).
SPP_XXX.PGM	SCP2/LCP2 Program. SCP2 or LCP2 program is already installed in the card. The programs in SmartMedia are used for S/W version upgrade.
PRI_VXXX.PGM	TEPRI program. TEPRI program is already installed in the card. The TEPRI program in SmartMedia is used for S/W version upgrade.
DATABASE.MPP	This database file is created in SmartMedia when the DB is copied to SMDB in MMC 815. This file is created only when the SMDB is created in MMC 815.

## ACTION

1. Press TRANSFER 819.  
Display shows.
2. Press VOLUME to display the data of the files saved in SmartMedia.
3. Press HOLD and select [1] (YES) to delete the file shown on the LCD screen from SmartMedia.

# ASSIGN SYSTEM LINK ID

## DESCRIPTION:

This MMC is used to assign the system link ID for Q-sig and VoIP networking. In addition each Link ID is also associated with the IP address of the MCP2 card for that system for use when IP networking is used to connect to that system.

OPTION	DESCRIPTION
LINK ID	System ID used for networking. Unique ID is assigned for each node in the network. Note: "Node" refers to an OfficeServ 100 or OfficeServ 500 in the network.
SIGNAL G/W	IP address for each node in the network. The IP address assigned to the MCP in MMC 830 is used.
IP TYPE	Public or private type is assigned to each node for 'SELF'. The IP TYPE assigned in MMC 830 is applied.

## PROGRAM KEYS

03:CC PATH RSV: Y
```

```
NETWORK COS    (05)
03:CC PATH RSV: N
```

## MMC: 823

These are the selectable options:

**01 – CALL OFFER:** Enables a call to be offered to a busy called user and to wait for that called user to accept the call, after the necessary resources have become available. The busy called user is given an indication of the offered call. During the time that the call is offered, the called user may ignore the offered call or may attempt to make the necessary resources available (e.g. by releasing or placing on hold another call). When and if the necessary resources become available, the call shall be completed as a normal incoming call.

**04 – CC SIG CONN:** There are two ways in which Callback features controls signaling connections:

YES = connection retention method – the signaling connection is maintained until completion or cancellation.

N) = connection release method – the signaling connection is cleared after each phase of call independent signaling and a new signaling connection is established for each subsequent phase of call independent signaling.

**05 – CC SVC RETN:** There are two possible behaviors when User B is found to be busy again after User A responds to callback recall:

YES = service retention method – the CC Request remains in force at the Originating and Terminating nodes and the Terminating node commences the monitoring of User B again;

NO - service cancellation method – the Callback Request is cancelled at the Originating and Terminating nodes.

**06 – CCBS:** Completion of Calls to Busy Subscribers. This enables the Call Back feature over the network. YES – Callback enabled and NO = Callback disables. *Not available on QSIG over PRI networking.*

**07 – CCNR:** Completion of Calls on No Reply is a supplementary service which is offered to a calling User A. On encountering a called User B which does not answer, it allows User A to request that the PISN monitors User B and notifies User A when User B becomes free after a subsequent period of activity. On response by User A to that notification the PISN shall attempt to complete the call to User B.

**08 – CFB:** Call Forward Busy (CFB) enables a served user to have the node redirect to another user calls which are addressed to the served user's PISN number and meet busy. SS-CFB may operate on all calls or just those associated with specified basic services. The served user's ability to originate calls is unaffected by SS-CFB.

## MMC: 823

**09 – CFNR:** Call Forward No Reply (CFNR) enables a served user to have the PISN redirect to another user calls which are addressed to the served user's PISN number and for which the connection is not established within a predefined period of time. The served user's ability to originate calls is unaffected by CFNR.

**10 – CFU:** Call Forward Unconditional (CFU) enables a served user to have the node redirect to another user calls which are addressed to the served user's node number. CFU may operate on all calls or just those associated with specified basic services. The served user's ability to originate calls is unaffected by CFU. After CFU has been activated calls are forwarded independently of the status of the served user.

**11 – CI:** Call Intrusion (CI) is a supplementary service which, on request from the served user, enables the served user to establish communication with a busy called user (user B) by breaking into an established call between user B and a third user (user C). On successful intrusion, user C is either connected in a conference type connection with the served user and user B or disconnected from user B (isolated).

**12 - CI CAPABIL:** Intrusion Capability Level (1 ~ 3): An intrusion request is only accepted if the served user has a higher Call Intrusion Capability Level (CICL) than the Call Intrusion Protection Level (CIPL) of both user B and user C.

**14 – CI PROTECT:** Intrusion Protection Level (0 ~ 3) Refer to the above 12.

**23 – CONP LEVEL:** The calling user can be provided with the name identification information according to the CONP level, CONP Level (0 ~ 3).

**26 – CT RE-ROUTE:** Transfer By Rerouting (CT) is a supplementary service which enables a served user (User A) to transform two of that users calls into a new call between the other two users of the two calls (User B and User C). Each call can either be an incoming call to User A or an outgoing call from User A. After successful invocation of CT, User B and User C will no longer be able to communicate with User A.

**27 – DND TONE:** DND Announcement. As an implementation option, it may be possible for the served user to select a tone or announcement to be given to the calling user on invocation of DND.

**28 – DNDO:** Do Not Disturb Override (DNDO) is a supplementary service which enables a calling user to override DND at a called user, allowing the call to proceed as if the called user had not activated DND.

## MMC: 823

**29 – DNDO CAPABL:** DNDO Capability Level (0 ~ 3) The subscription parameter “DNDO Capability Level” (DNDOCL) shall be provided. The DNDOCL has a value in the range 1 (lowest capability) to 3 (highest capability). At least one of the DNDOCL values shall be offered.

**30 – DNDO PROTEC:** If DNDO Protection Level (1 ~ 3) is implemented then the subscription parameter “DND protection level” (DNDPL) shall be provided. The DNDPL has a value in the range 0 to 3 where 0 means no protection against DNDO and 3 means total protection against DNDO. The values 0 and 3 shall be offered. The values 1 and 2 may, as an implementation option, be offered.

**31 - PAGE.:** This feature allows station users in one node to initiate network pages to other page zones to different nodes in the network.

**32 - PATH REPL.:** Path Replacement (PR) is invoked by an ANF-PR user for an established call, allowing that call’s connection through the network to be replaced by a new connection. The direction of the new connection may be decided by the PR user. If the new connection is required to satisfy certain criteria, PR should be used in conjunction with other supplementary services.

**33 - PATH RETEN:** Path Retention -the retention of the network connection between the Originating and Terminating nodes so that a supplementary service (such as DNDO) can be invoked without establishing a new connection.

# NETWORK DIAL PLAN

## DESCRIPTION:

This MMC is the translation table that defines the extension dialing plan for the networked systems.

PROGRAMMED FIELD DESCRIPTIONS: PP:NONE → DDDD  
SZ:X MAX:XX MB:XX

PP Dial Plan Number (01-96).  
DDDD Link ID and leading digits for the extension numbers in that switch (8 characters maximum).  
SZ Number of digits in extension number (0-9).  
MAX Number of digits total (1-20) for ID number and extension number.  
MB Create mailbox for this extension range in this switch (Y/N).

## PROGRAM KEYS

UP & DOWN Used to scroll through options  
KEYPAD Used to enter selections  
SOFT KEYS Move cursor left and right

## ACTION

## DISPLAY

1. Press TRANSFER 824.  
Display shows.
2. Press UP or DOWN key to select plan number and press RIGHT soft key to move cursor.
3. Enter LINK ID and FIRST DIGIT of extension number using the keypad and press RIGHT soft key to move cursor.
4. Enter number of digits in the extension number. Cursor advances to next field.
5. Dial maximum number of digits. Cursor advances to next field.

01: NONE→  
SZ:0 MAX:00 MB:N

10: NONE→\_\_\_\_  
SZ:0 MAX:00 MB:N

10: NONE→ 0033  
SZ:0 MAX:04 MB:N

10: NONE→ 0033  
SZ:3 MAX:04 MB:N

10: NONE→ 0033  
SZ:3 MAX:06 MB:N

## MMC: 824

6. Press UP or DOWN key to select YES or NO for mailbox information.  
Press RIGHT soft key to make change and return to step 1.

10: NONE → 0033  
SZ: 3 MAX: 06 MB: Y

7. Press TRANSFER to store and EXIT  
OR  
Press SPEAKER to store and advance to next MMC.

**DEFAULT DATA:** NONE  
SZ: 0  
MAX: 00  
MB: N

# MMC: 825

# NETWORK OPTIONS

## DESCRIPTION:

When you have networked switches, this MMC is used to set the network related options for Caller ID and Voice Mail.

These are the options:

0	ADD NUMBER TO NAME	Assign to include the extension number in the name field of Q-SIG standard message.
1	USE REMOTE VM	Assign to use SVM on remote system.
2	REMOTE VM NUMBER	Assign to access number of remote SVMi when Remote VM is used.
3	REMOTE CID NUMB	Assign to use delete node number when CID number send to SVMi.
4	USE REMOTE ATTN	Assign to use Attendant on remote system.
5	REMOTE ATTN NUMB	Assign to access number of remote attendant when the remote attendant is used (one access number per ring plan).
6	SPNET SEND DIGITS	<p>When IP networking systems, this option determines the method used for sending digits between nodes.</p> <ul style="list-style-type: none"> <li>MGI Signalling: follows the "DTMF TYPE" setting in MMC 835 (inband or out of band) for signaling between nodes.</li> <li>MCP Signalling: MCP sends IPC messages to MCPs in other network nodes over IP with digit information. MGI is not involved. This does <u>not</u> apply to analog devices sending digits across the network (i.e. SLT)</li> </ul>

## PROGRAM KEYS

VOLUME	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to advance to the next MMC
HOLD	Used to clear previous entry

## MMC: 825

### ACTION

1. Press TRANSFER 825.  
Display shows.
2. Press RIGHT soft key to move cursor.  
  
Press UP or DOWN key to select  
YES or NO.
3. Press UP or DOWN key to select option  
and then follow step 2.
4. Press TRANSFER to store and EXIT or  
Press SPEAKER to store and advance to next  
MMC.

## MMC: 827

## CRM DSP MODE SELECT

### DESCRIPTION:

This program is used to select the mode on CRM daughter boards. The CRM (Common Resource Module) has several modes that can be set to deliver functions. The two modes that can be set for U.S. are DTMFR and CID. This CRM daughter card also provides six 5-party conference circuits per card. There are no settings for this conference feature, they are automatically included when the CRM is installed.

- 1) DTMFR: DTFM Receiver
- 2) R2: R2 signalling. Not used in the US.
- 3) CID: Caller ID receiver
- 4) R2/CID: R2 signalling and CID. Not used in the US.

### CONDITION

CRM board must be installed on the MCP2 for M software and the SCP2 for a single cabinet L software. It can be installed on the LCP2 for cabinet two or three if installed. The CRM can be installed in position 1 or 3 of the MCP2, SCP2, or LCP2 as indicated in the installation manual.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right

### ACTION

1. Press TRANSFER 827.  
Display shows.
2. Dial the cabinet number (1-3)  
OR  
Press volume button up or down to select cabinet numbers.  
Then press the right soft button to move cursor.

### DISPLAY

C: 1 B: 1  
DTMFR →DTMFR

C: 1 B: 1  
DTMFR →DTMFR

## MMC: 827

3. Dial the (B) number to enter the position on board (1 or 3) OR

Press volume button to select position. Then press right soft key to move cursor.

C:1 B:1  
DTMFR →DTMFR

### DEFAULT DATA

DTMFR is the default setting on CRM daughter boards.

**RELATED ITEMS: NONE**

**MMC: 829****LAN PRINTER PARAMETER****DESCRIPTION:**

This program sets the various parameters required for printing to a LAN connected device (PC or printer).

The eight types of data listed below can be displayed using the LAN printer or PC.

REPORT	LAN TCP PORT (TCP port of MCP providing the service)
[01] SMDR	5100
[02] UCD REPORT	5101
[03] TRAFFIC REPORT	5102
[04] ALARM REPORT	5103
[05] UCD VIEW	5104
[06] PERIODIC UCD	5105
[07] HOTEL REPORT	5106
[08] PMS	(NOT USED)

Ports 5100 ~ 5106 are fixed and are displayed in the “LAN TCP” field below.

The items that are set in this program are listed below.

00	DATA TYPE	Type of data to be displayed (01~08 above)
01	CURR STATUS	Current status of the LAN printer (READ ONLY FIELD) When “DESTINATION” is PC, this field will display “OFF” until PC is connected.
02	EMPTY BUFF	Prints all data left in the buffer
03	UPDATE LAN	Applies modified items When making any TCP/LAN related parameter, select “YES” to update LAN (and save) for changes to take effect.
04	DESTINATION	Select the device where your report prints.
05	PRINTER IP	Sets the IP address of the LAN printer
06	PRINTER TCP	Enter TCP port of printer (see printer manufacturer specifications)
07	LAN TCP	Displays LAN TCP port of the associated service shown in table above (READ ONLY)
08	RETRY COUNT	Retransfer attempt count (00~10)
09	RETRY WAIT	Wait time for retransfer(005~250 sec)
10	PJL ENABLE	Sets PJL(0. FALSE, 1. TRUE)

**MMC: 829**

11	LANGUAGE	Printer language(0. RAW, 1. PCL, 2. PS)
12	PAPER SIZE	Paper size(0. A4, 1. LETTER)
13	FONT TYPE	Font type(0. COURIER, 1. TIMES NEW ROMAN)
14	DUPLEX ENAB	Sets duplex(0. FALSE, 1. TRUE)
15	ORIENTATION	Sets orientation(0. PORTRAIT, 1. LANDSCAPE)
16	PRINT TRAY	Sets printer tray(0. DEFAULT, 1. TRAY 1, 2. TRAY, 3. MANUAL)
17	RESOLUTION	Resolution(0. 300, 1. 600)
18	LINE/PAGE	Line per page

**PROGRAM KEYS**

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC

**ACTION**

1. Press TRANSFER 829.  
Display shows.
2. Enter type of data to be printed  
OR  
Press VOLUME to select the type and  
press the RIGHT soft button to move the  
cursor.
3. Enter the item number  
OR  
Press VOLUME to select the item and press  
the RIGHT soft button to move the cursor.
4. Select the data  
OR  
Press the VOLUME to select the data and  
press the RIGHT soft button to move the  
cursor.
5. Press TRANSFER to exit the program  
OR  
Press SPEAKER to move on to the next  
program.

## MMC: 830

## ETHERNET PARAMETERS

### DESCRIPTION:

This MMC provides the means to configure the Internet Protocol (IP) addressing of the OfficeServ 500 system MCP2 card. This MMC must be utilized if there are ITP series phones and/or MGI cards used on the system. Even without any VoIP applications you still have to configure the MCP's IP for LAN based OSM connections.

- **NOTE:** When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- **PLEASE ALSO NOTE:** The first 3 parameters: *SYSTEM IP ADDR*, *SYSTEM GATEWAY*, and *SYSTEM NET MASK* are stored separate from the main system database, thus will not be defaulted when MMC811 "CLEAR MEMORY" is performed. Furthermore, any changes to these parameters will not be applied until the MCP2 is reset.

- **SYSTEM IP ADDR:** Specifies the IP address for the MCP2 card.
- **SYSTEM GATEWAY:** Specifies the designated LAN gateway IP address used for contacting IP devices beyond the local network subnet.
- **SYSTEM NET MASK:** Specifies the IP subnet mask. This parameter is used by the system to calculate the range of IP devices (subnet) that are within "direct reach" of the MCP2 (without having to go through the designated network IP gateway).
- **SYSTEM RESET:** Prompt to restart system MCP2 when system IP address is changed. This reset is similar to MMC 811. **You must use this reset for any changes in this MMC to take effect.**
- **SYSTEM IP TYPE:** Defines which IP addressing relationship is used for communications to and from the MCP2 card.
  - ❑ **PRIVATE IP ONLY** – the system assumes all ITP/VOIP devices are on the same network. Traffic involving non-IP based devices (such as analog trunks, digital keysets, voicemail, etc.) are handled VIA the MGI card.
  - ❑ **PRIVATE w PUBLIC** – the system knows that there is a mixture of ITP/VOIP devices on the same network and on remote network(s), thus communicates accordingly based upon the entries in MMC 840 (for ITP phones) or MMC 838 (for other MCP2).

**MMC: 830**

- ❑ **Public IP Only** – use when MCP2's IP address is exposed to the public network.
- **SYSTEM PUBLIC IP:** The MCP2 will originate communications, to ITP/VOIP devices outside the local network, using this IP address. Communications to/from this IP will require involvement of the MGI card. The system identifies communications to/from this address as "public". This allows devices, on remote networks/subnets, to establish communications with the system, without exposing your LAN. [See "SYSTEM IP TYPE."](#)
- **SYSTEM MAC ADDR:** For your reference, and cannot be changed. The unique hardware (MAC) address of the MCP2 card.
- **PCMMC ADDRESS:** *No entry required. Reserved for future use.*
- **SM MANAGER IP:** *No entry required. Reserved for future use.*
- **NEWS ADDRESS:** *No entry required. Reserved for future use.*
- **CTI SERVER ADDRESS:** *No entry required. Reserved for future use.*

**PROGRAM KEYS**

## MMC: 831

## MGI PARAMETERS

### DESCRIPTION:

This MMC provides the means to configure the Internet Protocol (IP) addressing of the OfficeServ 500 system MGI card(s). This MMC must be utilized if there are ITP series phone(s) and/or MGI card(s) used on the system.

NOTE: This MMC cannot be accessed unless there is an MGI card installed in the system.

- NOTE: When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- PLEASE ALSO NOTE: The first 3 parameters: *IP ADDRESS*, *GATEWAY*, and *SUB MASK* - changes to these parameters **will not be applied** until the MGI is reset, use the reset option below to reset the MGI.

- **IP ADDRESS:** Specifies the IP address for the MGI card.
- **GATEWAY:** Specifies the designated LAN gateway IP address used for contacting IP devices beyond the local subnet.
- **SUB MASK:** Specifies the IP subnet mask. This parameter is used by the system to calculate the range of IP devices (subnet) that are within “direct reach” of the MGI (without having to go through the designated network IP gateway).
- **IP TYPE:** Defines which IP addressing relationship is used for communications to and from the MGI card.
  - PRIVATE IP ONLY – the system assumes all ITP/VOIP devices are on the same network. Traffic involving non-IP based devices (such as analog trunks, digital keysets, voicemail, etc.) are handled VIA the MGI card.
  - PRIVATE w PUBLIC – the system knows that there is a mixture of ITP/VOIP devices on the same network and on remote network(s), thus communicates accordingly based upon the entries in MMC 840 (for ITP phones).
  - Public IP Only – use when MGI’s IP address is exposed to the public network.
- **PUBLIC IP:** The MGI will originate communications, to ITP/VOIP devices outside the local network, using this IP address. The system identifies communications to/from this address as “public”. This allows devices, on remote

**MMC: 831**

networks/subnets, to establish communications with the system, without exposing your LAN.

- **MAC ADDRESS:** Displays the physical MAC address of the MGI. The value cannot be changed.
- **CARD RESET (Only available on MGI3 card):** Use this option to reset the MGI. The MGI needs to be reset for changes to IP address, gateway or submask to take effect.

**PROGRAM KEYS**

## MMC: 832

## VoIP OUTBOUND DIGITS

### DESCRIPTION:

This MMC provides the means to set the MGI internal numbering plan for digit dialing and conversion when using IP trunking application.

- **ACCESS DGT:** This is the access code that is used once the MGI is accessed; this directs a call based on the routing tables used. An access code table then references an access code and correlates an IP address to the access code for routing. A maximum of 8 digits are available with 63 access code entries (00~62).
- **DGT LENGTH:** This field requests the number of digits that are expected to be received to make up the whole access code.
- **DEL.LENGTH:** This is the number of digits to delete after receiving the access code.

NOTE: If no digits are deleted the access code will be sent as part of the call to the destination to continue routing at the far end destination.

- **INSERT DGT:** This is the digit(s) to insert for routing at the destination. This can be used when different numbering plans exist or if a dial 9 access is needed to be inserted in the dialed digits.
- **IP TABLE 1:** This is the first table referenced for routing the access code to an IP address. The system has 63 IP tables (00~62) with 16 entries (00~15) in each table.
- **IP START:** This entry indicates where in a table to start looking for an IP code to associate with the access code. This can be used to manage where to start looking for an IP address in high traffic MGI applications. Example: If IP address routing to the desired destination is known to be in the last 7 entries of a table the IP START location would be 8. IP address searching would start at entry 8.
- **GK USE:** This parameter determines whether a H.323 Gatekeeper (MMC836) will be utilized to establish this connection (0:no, 1:yes).

# MMC: 833

# VoIP IP ADDRESS

## DESCRIPTION:

This MMC provides the IP addresses in tables pointed to by the VoIP code entry (MMC 832). There are 63 tables with up to 16 entries each. The destination IP address is required to route dialed digits based on the access code and digits dialed. The IP entry field is divided into 4 sections allowing modification of separate IP address fields.

- NOTE: When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010

## PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC

## ACTION

1. Press TRANSFER 833.  
Display shows the first table number.  
Press UP or DOWN key to select a table OR  
press RIGHT soft key to move cursor.
2. Press UP or DOWN key to select a table entry  
OR press RIGHT soft key to move cursor.
3. Using the keypad input a 12 digit IP address  
OR
4. Press TRANSFER to store and exit  
OR  
Press SPEAKER to store and advance to next  
MMC entry.

## MMC: 834

## H.323 OPTION

### DESCRIPTION:

This MMC provides various VoIP support options. The options set in this MMC are set systemwide.

- **GATEWAY CALL ID:** This a 1 to 12 digit numeric entry that identifies this system.
- **H.323 FAST SETUP:** Enables or disables the H.323 Fast Start call setup method.
- **CALLER ID TYPE:** This option controls the calling party identification type. There are 3 possible selections: *ANI* which shows the calling station number when the call is an MGI to MGI, *IP* which shows the calling MGI IP address, and *GWID* which is a 1 to 12 digit preprogrammed ID.
- **TUNNELING:** Enables or disables the need for additional channels using H.245 signaling. Tunneling allows use of the H.245 signal channel with the Q.931 channel.
- **DEFAULT DIL NO.:** This allows programming of the default DIL number when digits are missing, or incorrect on an inbound call.
- **CODEC AUTO NEGOT:** Enables or disables Auto CODEC Negotiation when the MGI is used as a trunking gateway. This parameter is set as ON or OFF.
- **SIGNAL PORT:** Indicate the port number for H.323 signaling and sets a range of numbers allowed by firewall equipment. The common/default IP path or port used is 10000. When using the MGI as a trunking gateway the formula for which ports to open depends on the number of VoIP channels. The formula is as follows:  $\text{base signaling port (10000)} + 128 + 2 * (\# \text{ of Voip ports} - 1) + 1$ .
- **SEND CLIP TABLE:** Refers to SEND CLI NUMBER (MMC 321), which provides calling party identification when using the MGI as a trunking gateway. This provides station ID of the calling station. A single digit value corresponding with the desired table in MMC321 should be entered here. This is only used when MMC 405 value is null. Default 1.
- **INCOMING MODE:** This option selects how incoming calls are routed: FOLLOW DID TRANS [default] (MMC 714), FOLLOW TRUNK RING (MMC406),

## MMC: 834

or FOLLOW INCOM DGT (MMC 724) when the MGI is used as a trunking gateway.

- **ALLOW GW CHECK:** When using a gatekeeper, this permits the MGI to check for gatekeeper presence. This parameter is set as ENABLE or DISABLE

### PROGRAM KEYS

## MGI DSP OPTION

### DESCRIPTION:

This MMC provides various MGI DSP options. The options set in this MMC are MGI-type specific. Be sure you have selected MGI3 or MGI2, before using right soft key to select a parameter to modify.

- Please note that the MGI1 is not used in North America.
- \* denotes MGI3-only parameter.
- **CODEC FRAME COUNT\*:** Selects which audio codec compression will be used and transmission interval time of VoIP packets generated from MGI card. Selections - MGI3: G729A (8K), G.729 (8K), G.711 (64K), G.723.1 (5.3K~6.4K). Does not apply to ITP to ITP communications. Use settings in MMC 840/MMC 841 for ITP to ITP communications.
- **ECHO CANCEL:** Enables or disables echo cancellation (0: disable, 1: enable). This function removes echo that is generated by voice reflection and packet delay.
- **SILENCE SUP:** This parameter determines whether silence suppression is used (0: disable, 1: enable). This prevents transmission during the silence period of a call, and conserves bandwidth when enabled.
- **IN FILTER\*:** This option select input filtering of the DSP (0: disable, 1: enable). This should always be set as ENABLE.
- **OUT FILTER\*:** This option select output filtering of the DSP (0: disable, 1: enable). This should always be set as ENABLE.
- **INPUT GAIN\*:** PCM input gain value of DSP. The range is -31dB~31dB (0~63). This sets the quality of PCM voice from the VoIP DSP to the site.
- **VOICE VOL\*:** This value selects the voice volume. The range is -31dB~31dB (0~63).
- **FRAME COUNT\*:** This value determines the transmission interval time of VoIP packets generated by the MGI card. The range is 1~9 (MGI 3) 2~8 (MGI 2).
- **JITTER OPT\*:** This is a scale value that introduces a intentional buffer (delay) of the transmission of VoIP packets generated by the MGI card. This value

## MMC: 835

determines whether the focus is on packet loss or packet delay. The range is 00~12.

- **MIN JITTER:** Decides the minimum time to consider delay for jitter adjustment. The range is 010~300ms (MGI 3) 020~300ms (MGI 2).
- **MAX JITTER:** Decides the maximum time to consider delay for jitter adjustment. The range is 010-300ms (MGI 3) 020-300ms (MGI 2).
- **FAX ECM\*:** This option selects retry of Fax-over-IP, in the case that errors are detected (0: disable, 1: enable).
- **MAX FAX CNT\*:** This is maximum number of channels that can be *simultaneously utilized* for Fax-over-IP. The range is 00~16.
- **DTMF TYPE:** There are two types of DTMF transmission: INBAND, which is industry standard (H.245) type DTMF transport, and OUTBAND which is a Samsung proprietary method. Please note that the MGI 2 only supports INBAND.
- **TOS FIELD\*:** .An eight-bit binary value that will be utilized by external routers, switches, etc (*that optionally support TOS-bit prioritization*) – to identify the transport-priority value of data packets generated by the MGI card. This value can be left at default value (00000000) if your network infrastructure does not support this method of bandwidth management.
- **FAX RETRY:** The number of attempts to resend a failed fax transmission.
- **RTP CHECK TIME:** Interval between RTCP packets sent from MGI cards.

**Note:** Does not apply to ITP to ITP calls (where both ITP's are in same public zone, or both in same private zone). For ITP to ITP calls, use settings in MMC 840/MMC 841.

## H.323 GK OPTION

### DESCRIPTION:

Provides a means to set the MGI parameters for an optional external industry-standard H.323 network gatekeeper, using Registration, Admissions, and Status signaling (RAS). The settings are system wide.

- **NOTE:** When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- **GK CONNECTION:** This determines if the MGI is to connect to a gatekeeper. The options are: ENABLE or DISABLE.
- **GK ROUTING:** This enables or disables routing of calls through a gatekeeper. The options are: ENABLE or DISABLE.
- **GK IP ADDRESS:** This is gatekeeper's IP address.
- **GK NAME:** This is alphanumeric name identifier of the gatekeeper. An entry of 9 characters with a space followed by an additional 6 alpha-numeric characters.
- **ALTER GK IP ADDR:** This provide for an alternate gatekeeper address.
- **H.323 GATEWAY ID:** This is the H.323 identifier used by the MGI when registering with the gatekeeper. This can be up to 16 characters in length.
- **E.164 GATEWAY NO:** This is the E.164 identifier used by the MGI when registering with the gatekeeper. This can be up to 16 digits in length.
- **GK KEEP ALIVE:** This is the timer that the MGI uses to acknowledge the presence of the gatekeeper. The range is 000~999 seconds.
- **GK DOWN ROUTE:** This provides an alternate route in case the primary gatekeeper is down. Selections are PSTN or ALTER GK.
- **GK RAS TYPE:** Select if AUTO or MANUAL, depending on your gatekeeper's capabilities.
- **URQ REASON MODE:** Select ON or OFF for usage of Unregister Request RAS (URQ) messages.

## MMC: 836

- **RRQ FAIL TIME:** Programs the time frame to re-send Registration Request RAS (RRQ) messages to a gatekeeper. Default is 30 seconds. The range is 1~99.
- **GRQ SEND:** Select ON or OFF for usage of Gatekeeper RAS Request (GRQ) messages.
- **USE MULTI E.164:** When enabled the E.164 identifier can be assigned up to 32 lists.
- **E.164 LISTS (1):** This is the E.164 identifier used by the H.323 trunk when registering with the gatekeeper (max 32 lists with 16 digit string length).
- **GK REGISTERED:** GK registration status.

## SIP OPTIONS

### DESCRIPTION:

This MMC permits the adjustments of optional Session Initiation Protocol (SIP) trunking parameters. The MGI supports SIP and H.323 on a per call-per-port basis. The settings are systemwide.

- **NOTE:** When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010

- **GATEWAY CALL ID:** This a 1 to 12 digit numeric entry that identifies this system.
- **CALLER ID TYPE:** This option controls the calling party identification type. There are 3 possible selections: *ANI* which shows the calling station number when the call is MGI to MGI, *IP* which shows the calling MGI IP address, and *GWID* which is a 1 to 12 digit preprogrammed ID.
- **DEFAULT DIL NO.:** This allows programming of the default DIL number when digits are missing, or incorrect on an inbound call.
- **UDP PORT: TRUNK:** Sets the UDP port used on a trunk call.
- **UDP PORT: PHONE:** Sets the UDP port used on a SIP phone call.
- **RE-TRANS. T1 TIME:** The initial re-transmission time if no answer based on the RFC2543 specification. Default 500ms. The range is 0~9900.
- **RE-TRANS. T2 TIME:** The maximum re-transmission time if no answer based on the RFC2543 specification. Default 4000ms. The range is 0~9900.
- **RE-TRANS. T4 TIME:** The time the User Agent Server waits after receiving the ACK message. Based on the RFC2543 specification. Default 5000ms. The range is 0~9900.
- **GENERAL RING TM:** The server shall retransmit the response during this amount of time until the requested retransmission is received. For example, the wait time after sending 200 OK for INFO. The range is 0~99900.

## MMC: 837

- **INVITE LING TM:** After the client sends ACK for the INVITE Final Response, the client cannot confirm if the server received the ACK message. The client waits for this amount of time after sending ACK for the Final Response. The range is 0~99900.
- **PROVISIONAL TIME:** After receiving the Provision Response, the User Agent shall wait for this amount of time until Timeout ends. The range is 0~999900.
- **INV.NO RESP TIME:** Before sending Cancel for the Invite Request, the User Agent shall wait for this amount of time. The range is 0~99900.
- **GEN.NO RESP TIME:** Before sending Cancel for General Request, the User Agent shall wait for this amount of time. The range is 0~99900.
- **REQ.RETRY TIME:** After sending General Request, the User Agent shall wait for the Final Response for this amount of time. The range is 0~99900.
- **SIP SERVER ENBLE:** *ENABLE* or *DISABLE* to use an optional external industry-standard SIP Server.
- **SIP SERVER IP:** Sets SIP server IP address.
- **SIP SERVER PORT:** Sets the port to use on the SIP Server.
- **SIGNAL PORT:** Indicate the port number for signaling and sets a range of numbers allowed by firewall equipment. The common/default IP path or port used is 10000
- **SEND CLIP TABLE:** Refers to SEND CLI NUMBER (MMC 321), which provides calling party identification when using the MGI as a trunking gateway. This provides station ID of the calling station. A single digit value corresponding with the desired table in MMC 321 should be entered here. This is only used when MMC 405 value is null.
- **INCOMING MODE:** This option selects how incoming calls are routed: FOLLOW DID TRANS [default] (MMC 714), FOLLOW TRUNK RING (MMC 406), or FOLLOW INCOM DGT (MMC 724) when the MGI is used as a trunking gateway.
- **ALLOW GW CHECK:** Enable the check for the presence of a gateway.
- **SIP REGISTERED:** Displays registration status to the SIP server.

## MMC: 838

## PRIVATE IP ADDRESS

### DESCRIPTION:

This optional MMC provides a means for the MCP2 to communicate with remote VoIP gateways on a network consisting of a mixture of private and public IP addresses. If your network consists of IP addressing that is *entirely* private OR *entirely* public, you do not need to utilize this MMC. There are 80 entries.

- NOTE: When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC

### ACTION

1. Press TRANSFER 838.  
Display shows the first available option.  
Press UP or DOWN key to select an entry  
OR  
Press the RIGHT soft key to move cursor.
2. Press UP or DOWN key to select an option  
OR  
Press RIGHT soft key to move cursor.
3. Enter IP address in 3 digit entry format. IE  
105.52.10.20 is input 105.052.010.020.  
Press RIGHT soft key to enter data and  
move cursor to the Step 1 position.
4. Press UP or DOWN key to select another  
entry OR Press RIGHT soft key to move  
cursor  
OR  
Press TRANSFER to store and exit OR press  
SPEAKER to store and advance to next MMC.

## MMC: 840

## IP SET INFO

### DESCRIPTION:

This MMC provides a means to register the IP keyphones with the OfficeServ 500 system. During registration, the IP and MAC addresses are also registered. The User ID and Password must match the table entry in this MMC for the IP keyphone to be registered. System default numbers start at 3201~3280. System default User ID's match the default station numbers. (3201~3280). The system default password is 1234. IP keyphones must be individually programmed with User ID and Password to register with the system.

- **NOTE:** When changing any IP address/value, listed below, three digits must be input for each (octet) field. Example 192.168.1.10 input must be: 192 168 001 010
- **USER ID:** This is the ID the IP keyphone must match to register with the OfficeServ 500 system. This entry can be alphanumeric.
- **USER PSWD:** This is the Password the IP keyphone must also have to register with the OfficeServ 500 system. This entry can be alphanumeric.
- **IP ADDR:** This is the IP address of the IP once registered with the OfficeServ 500 system. View only.
- **MAC ADDR:** This is MAC address of the IP keyphone once registered with the OfficeServ 500 system. View only.
- **SIG PORT:** Indicates the port number used for keyphone control signaling. This information will be needed when traversing NAT routers, firewalls, etc. View only.
- **VOICE PORT:** Indicates the port number used for transporting voice content. This information will be needed when traversing NAT routers, firewalls, etc. View only.
- **IP TYPE:** This is the type of IP network used where the ITP is located: PRIVATE or PUBLIC, or PUBLIC with FIREWALL. "PUBLIC with FIREWALL" option must be selected when there are firewalls/NAT routers between system and remote ITP's.
- **DSP TYPE:** This selects which CODEC this keyphone's DSP will use. G.729A (low bandwidth) or G.711 (high bandwidth). This applies to ITP to ITP communication only. ITP to TDM follows MMC 835.

## MMC: 840

- **PHONE TYPE:** This the type of IP keyphone used. SAMSUNG or SIP (future). Please use SAMSUNG for the ITP series of keyphones.
- **REGIST CLR:** This is used to clear the registration of a particular IP keyphone. If a keyphone is relocated to a different physical subnet, it is very important that the keyphone registration is cleared and re-established with the proper IP information.
- **FRAME CNT\*:** This is the sampling rate per frame. The lower the frame count the higher the bandwidth consumed per call. Range is 20 ms ~ 40 ms. Applies only to ITP calls.
- **JITTER SIZE\*:** This is the programmable time delay to buffer packets. Range 10 ms~90 ms. Applies only to ITP to ITP calls.
- **TOS FIELD\*:** Allows the setting of Type of Service bits to allow precedence when using router that support this field. Applies only to ITP to ITP calls.
- **SW VERSION:** Software version of the particular ITP keyset. View only.
- **SW UPGRADE:** This is an IP phone software upgrade command. The TFTP server address must be programmed in MMC 841 for this to work. When selecting YES and pressing the right soft key, the selected ITP will be upgraded to software on TFTP server. MMC 841, "ITP version upgrade" must be set to MMC command.
- **TIME ZONE:** Sets the time off-set of IP phone from the system clock. This is used for IP phones on different time zones than the system. By adjusting this parameter the remote ITP phone's clock display will show local time of the time zone where it is located.
- **PUB TO PUB:** When set to "USE MGI" calls between two remote ITP phones located in the same private zone (or same public zone) will be forced to use an MGI channel. Select the "USE MGI" option if you encounter one-way audio or no audio between remote ITP phones.
- **PRIVATE IP:** Displays the private IP address (local IP) of the ITP phones (view only).
- **SIG TYPE**

**Note:** These settings are effective only if MMC 841, "ITP DSP PARA", DOWN=PHONE DATA.

**MMC: 841****SYSTEM IP OPTION****DESCRIPTION:**

This MMC provides various proprietary Samsung VoIP/IP integration options. The options set in this MMC are system-wide.

No	Option	Description	Default
0	PHONE VERSION	Sets running IP-based phone and new phone software version with the system. For example if version is 2.05 enter 0205. The version must match the version of software loaded in TFTP server. 0 LARGE DGP: Large LCD phone 1 LARGE ITP: Large LCD IP-based phone 2 2LINE ITP2: line LCD IP-based phone 3 WIPM APPL: Wireless IP-based mobile phone software. 4 SOFT PC 5 SOFT PDA 6 WIPM BOOT: Wireless IP-based mobile phone boot program. 7 SOFT MENU: Soft menu version	0000
1	PHONE TFTP IP	Sets phone software upgrade TFTP server IP address.	0.0.0.0
2	ITP REGISTRATION	Defines the method that IP-based phones use to register themselves with the system.	-
		0 TYPE: Defines the method that IP-based phones use to registration themselves with the system. a) SYS PSWD: System will authenticate the IP-based phones with the value contained within parameter ITP REGISTRATION: PSWD within this same MMC. b) ITP PSWD: System will authenticate the IP-based phones according to entries made in MMC 840. c) DISABLE: System will not authenticate IP-based phones at all.	SYS PSWD
		1 PSWD: This is a system-wide password value used for registration of IP phones.	'1234'
3	EASYSET OPTION	Sets EasySet link via LAN option with the system.	-
		0 PSWD: This is a system-wide password value used for authentication of EasySet server.	'1234'
		1 ALIVE TIME: This is a EasySet link via LAN alive check timer.	0 SEC

**MMC: 841**

No	Option	Description	Default
4	CTI LINK OPTION	Sets CTI link via LAN option with the system.	-
		0 SMDR REPORT: Sets YES or NO for SMDR data to CTI link via LAN.	NO
		1 UCD REPORT: Sets YES or NO for UCD data to CTI link via LAN.	NO
		2 ALIVE TIME: This is a CTI link via LAN alive check timer. If this sets 0, the system will not check link alive.	300 SEC
5	ITP DSP PARA	Sets IP phone DSP parameters of system-wide.	-
		0 M-FRAME: This value determines the transmission interval time of VoIP packets generated by the IP phone. This data is effective only when DOWN = SYS DATA in this MMC. The range is 10~40 ms. Applies only to ITP to ITP calls (when both ITPs are in same zone).	10 ms
		1 JITTER: Decides the minimum time to consider delay for jitter adjustment. This data is effective only when DOWN = SYS DATA in this MMC. The range is 10~90 ms. Applies only to ITP to ITP calls (when both ITPs are in same zone).	20 ms
		2 TOS: An eight-bit binary value that will be utilized by external routers, switches, etc(that optionally support TOS-bit prioritization)-to identify the transport-priority value of data packets generated by the IP phone. This value can be left at default value(00000) if your network infrastructure does not support this method of bandwidth management. This data is effective only when DOWN = SYS DATA in this MMC. Applies only to ITP to ITP calls (when both ITPs are in same zone).	all bits 0
		3 DOWN: Determines data uses system-wide data or each phone data for IP-based phone DSP control. a) SYS DATA: System-wide data will be used.(MMC 841 data) b) PHONE DATA: Each phone data will be used.(MMC 840 data)	SYS DATA
6	ITP TX GAIN/HSET	Sets IP-based phone Handset TX gain value of each level.	-
7	ITP RX GAIN/HSET	Sets IP-based phone Handset RX gain value of each level.	-

**MMC: 841**

No	Option	Description	Default
8	ITP TX GAIN/MIC	Sets IP-based phone MIC gain value of each level.	-
9	ITP RX GAIN/SPKR	Sets IP-based phone SPKR gain value of each level.	-
10	ITP VERS UPGRADE (“PHONE TFTP IP” and “PHONE VERSION” must be set).	Sets IP-based phone software upgrade option with the system. Used for automatic software upgrades.	-
		0 TYPE: Sets IP-based phone software upgrade type.. a) MMC COMMAND: IP-based phone software upgraded manually in MMC 840. b) PHONE CON: IP-based phone software upgraded automatically at phone connection. c) AUTO TIME: IP-based phone software upgraded automatically at set time.	MMC COMMAND
		1 START TIME: IP-based phone software automatic upgrade start time.	0000. (Disable)
		2 INTERVAL: IP-based phone software automatic upgrade interval time.	10 seconds.
11	MGI ALIVE PERIOD	Time interval between heart beat check between MGI and MCP.	-
12	LICENSE KEY	Soft phone license key	NONE
13	LICENSE STATUS	SOFTP ALLOW	0
		SOFTP USED	0
		SOFTP CONN	0
		NEWS ALLOW (not supported in US)	NO

## MMC: 844

## IP STATION TYPE

### DESCRIPTION:

This MMC is used to assign the IP station type as either DESKTOP PHONE or MOBILE PHONE. The L version software is indexed as 001 to 240 because it supports up to 240 IP stations. The M version software is indexed as 001 to 120 because it supports 120 IP stations. The default numbering plans MMC 724 reserves directory numbers 3201 (INDEX 001) to 3299 (INDEX 099) for IP DESKTOP PHONES.

When more directory numbers are needed for IP PHONES changes MMC 724-IP STN NUM PLAN as required.

1. ITP 5112L and 5121D must be set as DESKTOP PHONE.
2. The WIP5000M, 802.11b wireless IP handset must be set as MOBILE PHONE.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options

# MMC: 845-COMBO

# WLI PARAMETERS

## DESCRIPTION:

This program is used to set multiple parameters related to the WLI board inter-working.

The WBS24 wireless BTS can automatically start in order to reflect the changes when modifying parameters. If the system ID or system key is changed, all the previous terminal information is initialized.

### <WLAN Parameter>

No.	Parameter	Description
00	SYSTEM ID	ID used to classify the system in the wireless environment. Different IDs are used according to the system(Mandatory entry item)
01	SYSTEM KEY	Key used to register a terminal. Different values should be used according to the system. If you change the default, you can use a wireless terminal and supply power to WBS24(Mandatory entry item)
02	1 <sup>st</sup> DNS IP	IP address of the 1 <sup>st</sup> Domain Name Server (DNS)
03	2 <sup>nd</sup> DNS IP	IP address of the 2 <sup>nd</sup> of Domain Name Server (DNS)
04	2 <sup>nd</sup> WBS IP	All IP addresses of WBS24 used by the wireless terminal in the system. Use the default if there is no IP collision with other devices connected to the same subnet
05	CODEC LIST	CODEC used in a VoIP call between WBS24 and WIP-5000M. Currently, it is possible to set G.729A only
06	RF CHANNEL	Sets the RF channel value available in WBS24
07	VERSION	Indicates the WLAN module version
08	TFTP SERV	Sets the server IP for WBS24 upgrade
09	TFTP FILE	Sets the file name for WBS24 upgrade
18	WBS TX PWR	Changes TX power of the entire WBS24. Level 1 is minimum, level 4 is maximum.
19	CLR WBSREG	Initializes the entire entry information on WBS24

**MMC: 845-COMBO****<WBS Parameter>**

No.	Parameter	Description
0	IP ADDRESS	The IP address for connecting the Ethernet for WBS24 (Mandatory entry item)
1	GATEWAY	Gateway address of the network in which WBS24 is installed (Mandatory entry item)
2	NET MASK	Netmask of the network in which WBS24 is installed (Mandatory entry item)
3	MAC ADDR	WBS24 MAC address received by the system if WBS24 is connected
4	VERSION	Current software version of WBS24 connected to the system
5	STATUS	Alive operation status of WBS24 connected to the system
6	USE RF CH	RF channel number used in each WBS24
7	TX POWER	TX POWER of each WBS24. Level 1 is minimum, level 4 is maximum.
8	TIMEZONE	In case of WBS24(Basic), this parameter can be independently set at the area with a different time zone. This value is settings to correct time
8	PARA CLR	Initializes the WBS24 entry information

**Connecting WBS24**

WBS24 has two types, i.e. COMBO and BASIC. Two types of WBS24 is simultaneously unavailable in one system.

According to the AP type, CWBS is displayed if WBS24 is set to Combo, and BWBS if set to Basic on the LCD display. The AP type can be set in [AP TYPE] of [MMC 849].

**<SIP Parameter>**

Normally, use the default without change.

No.	Parameter	Description
0	RE-TRANS T1	When using Unreliable transmission protocol such as UDP, retransmission is performed if there is no response after transmission. RE-TRANS.T1 TIME is the Initial Retransmission Interval defined in RFC2543.
1	RE-TRANS T2	Maximum Retransmission Interval defined in RFC 2543.
2	RE-TRANS T4	Available for multiple purposes in RFC 2543. This parameter is used as time when User Agent Server(UAS) receives the ACK message and waits in the Unreliable transmission protocol.

**MMC: 845-COMBO**

No.	Parameter	Description
3	GEN RING TM	In the Unreliable transmission protocol, it is not sure that the client receives a response after the server sends the last response. At this time, the server should retransmit a response during this time until it receives the requested retransmission. For example, it is the time to send INFO 200 OK and wait.
4	INV RING TM	In the Unreliable transmission protocol, it is not sure that the server receives the ACK message after the client sends INVITE Final Response ACK. It is the waiting time after the client sends Final Response ACK.
5	GEN NO RESP	Waiting time before canceling the SIP Request.
6	INV NO RESP	Waiting time before canceling the SIP INVITE Request.
7	REQ RETRY	Waiting time before the final response to the SIP Request is received.
8	PROVISIONAL	When receiving the Provision Response, User Agent should wait during this time before Timeout expires.

**PRECONDITION**

None

## MMC: 845-DUAL-BAND WLI PARAMETERS

### DESCRIPTION:

This program provides detail parameters for WLAN settings.

#### <WLAN Parameter>

No.	Parameter	Description
01	CODEC LIST	CODEC used in a VoIP call between WBS24 and WIP-5000M. Currently, it is possible to set G.729A only
02	VERSION	Indicates the WLAN module version
03	MAX AP CH	Maximum channel per AP
04	WLAN SWITCH	Enable or disable the use of WLAN switch

According to the AP type, CWBS is displayed if WBS24 is set to Combo, and BWBS if set to Basic on the LCD display. The AP type can be set in [AP TYPE] of [MMC 849].

#### <SIP Parameter>

Normally, use the default without change.

No.	Parameter	Description
1	GEN NO RESP	Waiting time before canceling the SIP Request.
2	INV NO RESP	Waiting time before canceling the SIP INVITE Request.
3	REQ RETRY	Waiting time before the final response to the SIP Request is received.
4	PROVISIONAL	When receiving the Provision Response, User Agent should wait during this time before Timeout expires.
5	RE-TRANS T1	When using Unreliable transmission protocol such as UDP, retransmission is performed if there is no response after transmission. RE-TRANS.T1 TIME is the Initial Retransmission Interval defined in RFC2543.
6	RE-TRANS T2	Maximum Retransmission Interval defined in RFC 2543.
7	RE-TRANS T4	Available for multiple purposes in RFC 2543. This parameter is used as time when User Agent Server(UAS) receives the ACK message and waits in the Unreliable transmission protocol.

**MMC: 845-DUAL-BAND**

No.	Parameter	Description
8	GEN RING TM	In the Unreliable transmission protocol, it is not sure that the client receives a response after the server sends the last response. At this time, the server should retransmit a response during this time until it receives the requested retransmission. For example, it is the time to send INFO 200 OK and wait.
9	INV RING TM	In the Unreliable transmission protocol, it is not sure that the server receives the ACK message after the client sends INVITE Final Response ACK. It is the waiting time after the client sends Final Response ACK.

**PRECONDITION**

None

**DEFAULT****<WLAN Parameter>**

No.	Parameter	Settings

# WIP INFO

## DESCRIPTION:

[MMC846] is used to display the WIP-5000M information and set some parameters. You can change USER ID, PASSWORD, and INSERT DGT.

No.	Parameter	Description
0	REGISTERED	Indicates whether the corresponding WIP-5000M is registered
1	LOCATED	Indicates whether the corresponding WIP-5000M is currently connected to the system
2	PHONE TYPE	Indicates the type of the corresponding WIP-5000M phone
3	WLI NUMBER	Number of WLI connected to WBS24 in service in the section where WIP-5000M is being used
4	WBS NUMBER	Number of WBS24 in service in the section where WIP-5000M is being used
5	IP OFFSET	Location of the IP pool where the IP assigned to WIP-5000M is located
6	IP ADDRESS	IP address assigned to the registered WIP-5000M
7	MAC ADDR	MAC address of the registered WIP-5000M
8	USER ID	Sets ID by the WIP-5000M user
9	PASSWORD	Sets password by the WIP-5000M user
10	INSERT DGT	If the number of digits you pressed when originating a call in WIP-5000M is more than 5, the set INSERT DGT is inserted before the number you pressed. However, the number you pressed should not be C.O. Line number, C.O. Line group number, LCR, network LCR, or number starting with the function code

## ACTION

1. Select the MMC number [846].
2. Select a desired WIP-5000M number.  
Or select a desired WIP-5000M number using the [▼Volume▲] button, and press [RIGHT] soft button to move the cursor.

## MMC: 849-COMBO

## WLI REGIST

### DESCRIPTION:

[MMC849] is used to enable or disable the registration of the WIP-5000M wireless terminal in WLAN. This MMC is also used to enable or disable WEP which is an encryption method of the WLAN data. If WEP is enabled, set the WEP key, and the key should be composed of 13 characteristics.

Parameter	Description
REGISTER VoWLAN	Sets whether to permit the new registration of WIP-5000M. If this parameter is disabled, it is impossible to assign and register the WIP-5000M IP as well as WBS24 IP.
WIP REGIST CLEAR	Clears the registration according to WIP-5000M. The De-registration mode includes 'FORCED' and 'NORAML'. The FORCED mode is used to clear the system-related DB in order to register a new WIP-5000M due to the damage of WIP-5000M. The NORMAL mode is used to clear both the system DB and WIP-5000M DB by exchanging messages between the system and WIP-5000M.
WBS WEP SERVICE	Enables the WBS24 Security. Enter the WEP key in advance.
WEP KEY	The WEP key is used to check the WBS24 Security, and 13 digits should be all entered.
STATIC WBS IP	Sets whether to use a static IP in WBS. This is used for BASIC type and not used for COMBO. This value should be set in advance before registering WIP-5000M.
STATIC WIP IP	Sets whether to use a static IP in WIP-5000M. This value should be set in advance before registering WIP-5000M.
SELECT AP TYPE	Selects the AP type to be used if only one type of AP is simultaneously available in one system. When changing the AP type, restart the system (Mandatory option item). This value should be set first when setting WLAN.

**MMC: 849-COMBO**

ACTION	DISPLAY
1. Select the MMC number [849].	849: WLAN CONFIG SELECT PROG ID
2. Press the [SPK] key to move to the Select menu.To activate registration, enter passcode first. Default is 0000.	ENTER PASSWORD ****
3. Select whether to enable or disable WIP-5000M registration.	REGISTER VoWLAN ENABLE
4. Clear the registration of the handset.	WIP REGIST CLEAR 3301: FORCED
5. If the WEP key is set, select WEB ENABLE.	WBS WEP SERVICE DISABLE
6. If you want to select ENCRYPTION, set the WEP key first. Enter 13-digit number.	WEP KEY
7. Select whether to use a Static WBS IP. This function is not available for COMBO IP.	STATIC WBS IP DISABLE
8. Select whether to use a Static WIP IP.	STATIC WIP IP DISABLE
9. Select the type of AP to be installed. BASIC type is not available to North America.	SELECT AP TYPE COMBO AP

## MMC: 851

## ALARM REPORTING

### DESCRIPTION:

This MMC is used to view, store, print or clear system alarms. There are two levels of faults displayed via alarm code, major alarms and minor alarms. Major alarms codes are usually service affecting and require a certified technician to determine the fault. A minor alarm indicates a fault that may or may not be service affecting and usually does not seriously degrade the systems operating capabilities. The alarm buffer will hold up to 100 alarms on a first in - first out (FIFO) basis. Alarms will provide a date and time stamp based on the system time. If applicable the hardware cabinet, port, and/or slot will be displayed. If an ALARM SIO port is programmed (MMC 804) alarm information can be printed on demand and also prints as alarm information is provided.

### ALARM REPORTING OPTIONS (Select one of the options)

0	VIEW ALARM	View alarm buffer
1	OVERFLOW CONTROL	OVERWRITTEN – When buffer is full, the oldest entry in buffer overwritten.  STOP RECORDING – When buffer is full, stop recording alarms.
3	CLEAR ALARM BUF	Clears alarm buffer.
4	PRINT ALARM BUF	Prints contents of alarm buffer to the assigned alarm IO port.

### ALARM CODE LOCATION DEFINITION (See Alarm Code Table)

C: Cabinet number  
S: Slot number  
P: Port number

Note: Cabinet, slot and port do not apply to all alarm codes

**RELATED ITEMS: [MMC 852 ALARM KEY ASSIGNMENTS](#)**

# MMC: 852 SYSTEM ALARM ASSIGNMENTS

## DESCRIPTION:

This MMC allows the assignment of system alarms to ring and display the alarms on stations that have the Alarm Key assigned. The System Alarm Key is programmed in Station Key Assignments (MMC 722). System Alarm key programming is tenant wide (tenant 1 and 2). Alarms not programmed to report to the System Alarm key will still be retained in the maintenance alarm buffer for Alarm Reporting (MMC 851). The alarm buffer will hold up to 100 alarms on a First In - First Out (FIFO) basis. Pressing the System Alarm key will silence the audible alarm until another alarm is generated by the system. Alarm conditions that have multiple causes i.e. T1 errors and synchronization loss will print all associated alarm information if an SIO port is programmed as an ALARM port. The specific fault alarm data can be displayed via MMC 851 System Alarm Reporting.

NOTE: Alarm Notification Off/On (0/1) determines if the alarm provides a visual and audible notification to the System Alarm key station(s).

Pressing the System Alarm key and the release key will silence the audible alarm only at the station that pressed the System Alarm key and the release key. See alarm displays table for assignments.

## PROGRAM KEYS

UP & DOWN	Used to scroll through system alarms.
KEYPAD	Used to enter selections
SOFT KEYS	Enter/leave option
SPEAKER	Used to store data and move to next MMC
TRANSFER	Enter/exit MMC

## ACTION

1. Press TRANSFER 852.  
Display shows.
2. Enter desired Alarm Display number (eg. 16)  
OR  
Press the up and down keys to select desired option and press the right soft key and to advance the cursor.
3. To select if the alarm is active press 1 for YES and 0 for NO. An entry will advance the cursor to return to step 2.

31	MJC17	WLI Block	The WLI card could not be accessed
32	MJD01	Sync Failure	Clocking on T1/PRI cards has become asynchronous.
33	MJD02	Sync Recovery	Clocking on T1/PRI cards has become synchronous.
34	MJD03	Red Alarm	Locally detected loss of PCM carrier on T1/PRI card for more than 250 ms. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
35	MJD04	Red Alarm Rec	PCM carrier detected locally on T1/PRI cards. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
36	MJD05	Yellow Alarm	Remotely detected failure transmitted in frame on T1/PRI card. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
37	MJD06	Yellow Alarm Rec	Remotely detected failure restored transmitted on T1/PRI card. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
38	MJD07	Blue Alarm	All one's being transmitted on facility on T1/PRI card. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
39	MJD08	Blue Alarm Rec	A blue alarm condition has been cleared. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>

## MMC: 852

ALM NO.	ALM CODE	ALARM	DEFINITION
40	MJD09	Bit Error Alarm	Alarm is activated when the when error rate exceeds $1 \times 10^{-6}$ errors. Note: $1 \times 10^{-6}$ is threshold for minor alarm, $1 \times 10^{-3}$ is threshold for major alarm errors on T1, PRI or BRI.. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
41	MJD10	NTWRK Event	An Implausible event has occurred on the PRI or BRI Network digital line. Protocols do not match or subscriber ID mismatch. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
42	MJD11	SPID Init Err	The BRI received an error from the network <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), Channel(1 through 16)</i>
43	MJD12	SPID Init Rec	The BRI has recovered from an error on the network <i>Alarm Data = Cabinet, Slot Channel C1,2 (S1 through 10), C (1 through 16)</i>
44	MJD13	LPBK Error	Internal on demand loopback failed. <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), (C1 through 24)</i>
45	MJD14	LPBK Recovery	Internal on demand loopback test passed. <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), (C1 through 24)</i>
46	MJD15	BRI DL Unavail	A BRI data link is out of service. <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), (C1 through 16)</i>
47	MJD16	BRI DL Recovered	A BRI data link is back in service. <i>Alarm Data = Cabinet, Slot Channel (C1,2) (S1 through 10), (C1 through 16)</i>
48	MJD17	RAM Error	An error has occurred in the T1/PRI or BRI card RAM. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
49	MJD18	T1 Restart	The T1 card has restarted <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>

**MMC: 852**

ALM NO.	ALM CODE	ALARM	DEFINITION
50	MJD19	PRI Restart	The PRI card has restarted <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
51	MJD20	BRI Restart	The BRI card has restarted <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
52	MJD21	PCM Loss	Loss of PCM coding on a digital facility. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
53	MJD22	PCM Recovery	Recovery of PCM coding on a digital facility. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
54	MJE01	MGI Restart	An MGI card has restarted.
55	MJE02	MGI Stop	An MGI card has stopped.
56	MJE03	MGI IP Duplicate	MGI IP address conflict.
57	MJE04	MGI Ntwk Error	
58	MJE05	MGI Ntwk Rec.	MGI Recovery.
59	MJE06	MGI DSP Error	
60	MJE07	MGI DSP Run	
	MJE10	SVMi Card Restart	Card Restarted
	MJE11	SVMi Card Halt	Card Halted
	MJE12	SVMi Card Down	Card When Down
	MNF32	SVMi Card Ready	[SVMi-16 Only] Alarm Code when SVMi-16 is Ready.
61	MNF01	Card Out	Alarm Code when SVMi card request the number to MCP after restarting. A circuit card mounted in a universal slot has been removed from service or is not recognized by the Common Control Processor <i>Alarm Data = Cabinet-Slot (C1,2)-(S 1 through 10)</i>
62	MNF02	Card In	A circuit card mounted in a universal slot has been returned to service. <i>Alarm Data = Cabinet-Slot (C1,2)-(S 1 through 10)</i>
63	MNF03	IPC Error	Inter processor communication error has occurred. <i>Alarm Data = Cabinet-Slot (C1,2)-(S 1 through 10)</i>

**MMC: 852**

ALM NO.	ALM CODE	ALARM	DEFINITION
64	MNF04	Trunk Fault	Out of service trunk detected via loop detect. Internal CODEC test. <i>Alarm Data = Cabinet-Slot Port (C1,2)-(S1 through 10), (P1 through 16)</i>
65	MNF05	Trunk Recovery	Out of service trunk detected via loop detected as out of service is now operational. <i>Alarm Data = Cabinet-Slot Port (C1,2)-(S1 through 10), (P1 through 16)</i>
66	MNF06	Trunk Disconnect	Out of service trunk detected via seizure of trunk. External seizure test. <i>Alarm Data = Cabinet, Slot Port (C1,2)-(S1 through 10), (P1 through 16)</i>
67	MNF07	Trunk Connect	Out of service trunk recovered via seizure of trunk External seizure test. <i>Alarm Data = Cabinet, Slot Port (C1,2)-(S1 through 10), (P1 through 16)</i>
68	MNF08	SIO TXQ Over	SMDR buffer above 80% capacity.
69	MNF09	SIO TXQ Under	SMDR buffer below 80% capacity.
70	MNF10	T1 Out of Service	A T1 digital line is out of service
71	MNF11	T1 In Service	T1 Digital line has been restored to normal service. <i>Alarm Data = Cabinet,Slot (C1-2,S1 through 10)</i>
72	MNF12	SIO Out	IO port has lost DTR <i>Alarm Data = SIO 1 through 6</i>
73	MNF13	SIO In	IO port has regained DTR. <i>Alarm Data = SIO 1 through 6</i>
74	MNF14	TODC Error	Time of Day Clock in the MCP has erred.
75	MNF15	TSW Over Alarm	TSW has been requested to exceed the capacity of available time slots. Maximum 192 per cabinet. <i>Alarm Data = Cabinet, Slot (C1,2) (S1 through 10)</i>
76	MNF 16	PSU Alarm	Indicates there are over 96 ports in a cabinet with a single DPCU and more power is required. ( DLI,SLI ports) <i>Alarm Data = Cabinet (1,2)</i>
77	MNF 17	PSU Alarm Rec	A second DPCU has been recognized when added after alarm condition of <i>Alarm Data = Cabinet (1,2)</i>
78	MNF 18	SLI Fault	An SLI card has been detected as out of service via an internal CODEC test. <i>Alarm Data = Cabinet, Slot Port (C1,2) (S1 through 10) (P1 through 24)</i>

**MMC: 852**

ALM NO.	ALM CODE	ALARM	DEFINITION
79	MNF 19	SLI Recovery	An SLI card detected as out of service has been detected as recovered and is in service via internal CODEC test. <i>Alarm Data = Cabinet, Slot Port (C1,2) (S1 through 10) (P1 through 24)</i>
80	MNF 20	PSU B Alarm	A second PSUB is required
81	MNF 21	DSS Alarm	The number of DSS units has been exceeded
82	MNF 26	SIO RxQ Over	The SIO receive buffer is over 80% full
83	MNF 27	SIO RxQ Under	The SIO receive buffer is back under 80% full
84	MNF 28	LAN Printer Err	A LAN printer has lost communication
85	MNF 29	LAN Printer Rec	A LAN printer has recovered communication
86	MNG 01	Phone Disconnect	
87	MNG 02	Phone Connect	
88	MNG 03	OFF Hook Alarm	
89	MNG 04	On Hook	
90	MNG 05	MGI Packet Loss	
91	MNG 06	MGI Packet Delay	

## MMC: 853

## MAINTENANCE BUSY

### DESCRIPTION:

This MMC is used to place stations, trunks, and common resources equipment in a maintenance busy condition. This can be used to isolate suspected intermittent problem equipment. Stations placed in maintenance busy will behave like a station in DND when called. The calling stations display (if equipped) will show "MADE BUSY" when called. Stations receiving DID or E&M type calls will receive a DND/ No more calls tone. The station display will still function with station and date. When the busy station is accessed, it will function like a locked out station. Trunks made busy can not originate calls. Ring down type trunks will still ring the programmed destination. Common resource equipment such as DSP's, CID DSP's and miscellaneous equipment such as page ports, AA ports or voice mail card ports can also be placed in a maintenance busy state.

### MAINTENANCE BUSY OPTIONS

- |              |   |                           |
|--------------|---|---------------------------|
| 0. TRK       | = | Trunks                    |
| 1. STN       | = | Stations                  |
| 2. PAGE      | = | Page Ports                |
| 3 AA         | = | Auto Attendant card ports |
| 4. DTMFR:DSP | = | DSP # 01-48               |
| 5. CID:DSP   | = | CID DSP # 01-42           |
| 6. R2MFC:DSP | = | R2MFC:DSP # 01-08         |
| 7. CONF:GRP  | = | CONF:GRP #01-24           |
| 8. MGI       |   |                           |

NOTE: Selectable conditions    0 = idle state  
    1 = busy state

NOTE: In cases of DSP/ CID DSP selection when DSP is not mounted display will show NONE. If mounted display will show IDLE by default.

### PROGRAM KEYS

UP & DOWN	Scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor or select option
SPEAKER	Used to advance to next MMC
TRANSFER	Exit

## MMC: 853

### ACTION

1. Press TRANSFER 853.  
Display shows busy functions.
2. Press UP or DOWN to select function and  
press RIGHT soft key to move cursor.
3. Enter station number  
OR  
Press UP or DOWN to select station and  
press RIGHT soft key to move cursor.
4. Press 1 to make busy or 0 to make idle  
OR  
Press UP or DOWN to select condition and  
press RIGHT soft key enter and to move  
cursor.
5. Press UP or DOWN to select another area  
OR
6. Press TRANSFER to exit  
Press SPEAKER to advance to the next  
MMC.

# DIAGNOSTIC TIME

## DESCRIPTION:

Provides a means to set the OfficeServ 500 Diagnostic Time. The OfficeServ 500 diagnostics tests include memory audits, internal loopback tests on digital trunks, DSP, CID DSP, AA DSP tests. Additional tests include CODEC tests on analog trunk and station cards and tone tests. If the diagnostics cannot complete the tests because of system traffic, the system will abort the test and retry during the next programmed diagnostic time. It is recommended to assign the diagnostic time during non-peak traffic periods.

## MMC: 855 SYSTEM HARDWARE OPTIONS

### DESCRIPTION:

This MMC provides a means to review the common use hardware that is mounted in the system. System Options show miscellaneous hardware and daughterboards. This enables the technician to review the available hardware without having to dismantle or power down the system to confirm if the hardware is mounted. This is a READ ONLY MMC.

### PROGRAM KEYS

UP & DOWN	Used to scroll through options
KEYPAD	Used to enter selections
SOFT KEYS	Move cursor left and right
SPEAKER	Used to store data and advance to next MMC

### ACTION

## MMC: 856 TECH PROGRAMMING LOGS

### DESCRIPTION:

This MMC lists the date, time and entry location of the last 8 times that technician programming was accessed. This will allow a technician to determine if there was unauthorised access to system programming and where this access occurred. The information stored in this log will consist of 2 elements, the date and time it occurred at and the access location.

There are 4 types of access location information as described below:

NNNN This would be the extension number of a keyset that had accessed programming directly.

MODEM This would indicate that programming was accessed by OfficeServ™ Manager (OSM) via the integrated V90 modem attached to the Left side of the main cabinet.

LAN This would indicate that programming was accessed by OfficeServ™ Manager (OSM) via the LAN connection.

SIO X This would indicate that programming was accessed by OfficeServ™ Manager (OSM) via one of the SIO connections where X is the number (2~3) of the SIO port that was used.

### PROGRAM KEYS

## SYSTEM OPTION

### DESCRIPTION:

Assigns several options (listed below) on a system wide basis.

#### OPTIONS

- |   |                   |   |
|---|-------------------|---|
| 0 | AUTO UPDATE TIME  | When this option is set to ENABLE The system will synchronize the system time and date setting to the data received on an ISDN call connect message. If a system has multiple PRI cards the PRIORITY 1 setting in MMC 826 will determine the card used.   |
| 1 | SYSTEM SPEED BIN  | <p>When this option is set to 500 The system will have a maximum of 500 system speed dial bins numbered 500 to 999. When set to 950 the system will have a maximum of 950 system speed dial bins numbered 050 to 999. Station speed dial bins will be 000 to 049.</p> <p>Note: Personal speed dial number changes from 2 digits to 3 digits when 950 is selected.</p> |
| 2 | IDLE WHEN ENBLOCK | <p>When this option is enabled the ITP-5121D keyset will receive incoming calls when dialing out before the SEND button is pressed. When disabled an incoming call will appear as a call waiting call if idle CALL key is available.</p> <p>Note: This option has no effect if #3 below is disabled.</p>  |
| 3 | 2 LINE ENBLOCK    | When this option is enabled the ITP-5121D keyset can dial a telephone then press the SEND button to place the call. This operates like a cell phone. When disabled the ITP-5121D sends each digit as you dial it.   |
|   | 2 ZONE EXT PAGE   | Use LB for Page.  |

## MMC: 861

- |   |                  |   |
|---|------------------|---|
| 4 | LP TRK TONE DISC | When this is set to ON loop trunk can be disconnected by detecting busy tone. |
|---|------------------|---|

## **PART 3. RECORD SHEETS**

### **3.1 BLANK DATA RECORD SHEETS**

The following blank data record sheets are provided for you to record the programmed data for each system you install.

#### **USEFUL GUIDELINES**

- A. Keep a record of each system programming in a safe place on-site.
- B. Use a pencil to record the data. Ink cannot easily be erased or changed.
- C. Always update the record sheets when changes are made to the system database.
- D. These sheets may be copied as needed.

	HHMM	LCRT	HHMM	LCRT	HHMM	LCRT	HHMM	LCRT
DAY								
SUN								
MON								
TUE								
WED								
THU								
FRI								
SAT								

Day reflects the day of the week for time change for LCR route selection. HHMM reflects at what time selection will occur for LCR route change. Hours are entered in 24 hour format, e.g., 1:00 P.M. = 13:00 (two digits required). Minutes are entered in normal format (two digits required). LCRT reflects the entry in MMC 712 regarding what time element will be used. Entries are 1–4.
