

SIP ALG Detector

A SIP ALG can and usually does exist on Routers, Modems or in rare cases a managed switch.

You must disable this feature for any VoIP service to operate as expected.

Client Based Testing

The sip-alg-detector.exe agent can test for the presence of a SIP ALG on the network the host PC is connected to.

Open the file and accept any permissions your windows/mac machine may ask for.

If the results = False then a SIP ALG was not detected by the client.

If the results = True then a SIP ALG is active and must be turned off.
